## Executive Summary

© UNICEF/2010/Ahsan Khan

Conventional wisdom in Bangladesh says that investing in urban slums will attract more rural migrants. Bangladesh is not alone. Brazil in the past adopted policies that discriminated against urban settlements by the poor, but eventually changed course.

Ample evidence shows that people in Bangladesh migrate from rural to urban areas in search of economic opportunities, not in search of basic social services. Indeed, such services are mostly nonexistent in slums, and when they are, they are provided mostly through unscrupulous middlemen using exploitative means – at an extremely high cost to slum dwellers. Data from the 2009 Multiple Indicator Cluster Survey (MICS) in Bangladesh make it clear that conditions in slum areas are much worse than those in most rural areas, even in regard to service delivery-type indicators such as secondary education attendance rates and skilled attendance at birth.

The natural trend towards urbanization cannot simply be halted or reversed. In fact, it is an important aspect of the country's development process and inherent to its evolution from a low income country to a middle-income country. It is also fundamental to the realization of "Vision 2021", which foresees economic growth that provides an average per capita income of USD2,000 a year.

Taking its cue from other countries, Bangladesh should consider this as a positive trend and act proactively by developing a socially inclusive urban development strategy in its sixth Five-Year National Development Plan. This would enable a rapidly growing slum population to more effectively contribute to the acceleration of economic growth and poverty reduction, instead of becoming an ever-increasing burden and obstacle to the development.

Evidence from India, China and Brazil indicates very clearly that efforts to ease inequalities generate larger dividends for poverty reduction than a more conventional focus on economic growth. It is time to accept this new paradigm and start to invest in human capital development in the slums of Bangladesh.

## Introduction

© UNICEF/2009/Shehzad Noorani

This report challenges the widely held belief that the situation of urban dwellers in Bangladesh is generally better than those living in rural areas. In fact, data drawn from a 2009 Multiple Indicator Cluster Study (MICS) clearly show that living conditions in urban slums are often appalling and, in fact, much worse than those in most rural areas.

These and other findings have implications for the country's development strategy, since, historically, most development programmes in Bangladesh have focused on rural areas. Evidence from countries including Brazil, China and India show that reducing inequalities yields larger dividends for poverty reduction than a more conventional focus on economic growth, and is a lesson from which Bangladesh could benefit.

The findings could also affect the country's approach to urban development. Dhaka is one of the fastest growing mega-cities in the world, with slum populations seemingly outpacing the growth of other urban areas. Still, the country has no comprehensive policy on urbanization or urban poverty reduction.

In the past it was widely believed that people migrated to the cities in search of better services. In fact, when asked about their reasons for migrating, most Bangladeshis cite economic factors.<sup>1</sup> And the areas in which migrants initially choose to settle – slums – are those with the lowest levels of services. Denying basic services to slum dwellers, therefore, cannot be justified as a means to halt or reduce rural-urban migration.<sup>2</sup>

# The Current Study

Several studies have been undertaken on the situation of the urban poor in Bangladesh. These studies generally focused on the poorest 20 per cent of the urban population, rather than the situation of slum dwellers specifically. The current study, based on MICS data, reveals large inequalities between slum and other populations – both urban and rural. The picture that results is sobering.

The data in this report are drawn from slums areas in four large cities (Dhaka, Chittagong, Khulna and Rajshahi), involving 134 clusters of 20 households each. The report looks at several social indicators and compares them with those of people living in non-slum urban and rural areas.

## Background

Bangladesh is the most densely populated country in the world (excluding some city-states), with an average of 1,050 people per square kilometre in 2005 (in contrast, the Netherlands has almost 400 people per square kilometre, and Brazil, 20). The 2009 MICS data showed that, in contrast to most countries, differences in coverage in social services are unusually small between urban and rural areas in Bangladesh, and for many indicators they are non-existent. However, when statistics for slum dwellers and other populations are disaggregated out, the situation changes dramatically.

For example, while the national average for net attendance in secondary education is 49 per cent (48 per cent in rural areas and 53 per cent in urban areas), it is only 18 per cent in urban slums. The situation is similar for most other social indicators, including skilled attendance at birth, with slum areas ranking significantly below the rural average, with better-off urban areas outperforming them both. Net attendance in secondary education is 64 per cent in Khulna City Corporation, for example, and just 14 per cent in Dhaka's slums. Despite their proximity to metropolitan areas where such services are available, access for slum dwellers is denied.

Some improvements in the social sector have been made since the 2006 MICS. However, when it comes to meeting the Millennium Development Goal targets, slums are performing significantly worse than most rural areas (at both the district and sub-district, or *upazila*, levels).

The fact that parts of cities (in this case, city corporations) are in a privileged position is to be expected. However, the finding that slums are among the worst performing areas is a new one for Bangladesh. Normally, based on physical proximity alone, slum dwellers should have greater access to basic social services than isolated rural areas. But this is not the case in Bangladesh.

## Key concepts

### *Rapid urbanization*

Despite the absence of a clear definition of what constitutes ‘urban’ in Bangladesh, it is readily apparent that the country is experiencing one of the most rapid urbanization processes in Asia, as more and more people from rural areas flock to the city. Most studies agree that urban populations in Bangladesh have grown from 5 per cent in 1971 to a 27 per cent in 2008,<sup>3</sup> suggesting that approximately 41 million people are currently living in urban areas. Nevertheless, Bangladesh remains a mostly agrarian country. The consensus estimate is that the urban population will reach 50 million in 2015, representing just less than a third (30 per cent) of the total population.

The contribution of the urban sector to the national gross domestic product (GDP) has also increased rapidly, from 26 per cent of GDP in 1972 to more than 50 per cent by 2005.<sup>4</sup> In 2000, industry represented 20 per cent of all employment in Dhaka; half of that was in the garment industry. Twenty eight per cent of female employment is in the garment industry;<sup>5</sup> this in itself is an important factor in female empowerment.

### *Urban populations*

The definition of the term ‘urban’ in Bangladesh is a work in progress. The Power and Participation Research Centre (PPRC)<sup>6</sup>, has just launched a proposed definition that involves a particular population density per square kilometre, a set minimum population size, and over 50 per cent of the labour force in non-agricultural occupations.

The census definition of ‘urban’ includes four distinct classes on the basis of population size:

- Mega-city (Dhaka): A statistical metropolitan area (SMA) with more than 5 million inhabitants. The population of Dhaka was estimated at 10.7 million in 2001
- A statistical metropolitan area: A city corporation and adjacent areas having urban characteristics (Chittagong, Khulna and Rajshahi)
- Municipality (*pourashava*): Area declared by the Local Government Division of Ministry of Local Government, Rural Development and Co-operatives.
- Other urban areas: Subdistrict (*upazila*) headquarters with urban characteristics.

An increase in the number of urban centres has occurred mainly as a result of the reclassification of areas.

During the current decade, the number of *pourashavas* jumped from 213 in 2001 to 309 in 2009. There is no official body that declares an area a *pourashava*; this is up to local governments that might seek (or not seek) an enhanced status.

The 2009 MICS classification split urban areas into three categories: 1) municipalities, 2) city corporations (non-slum areas) and 3) slums. The non-city corporation areas were excluded from the urban category and, for this reason, the proportion of the ‘urban’

<sup>4</sup> Ibid.

<sup>5</sup> Islam and Mustafa, ‘Poverty Impact Assessment’, January 2006, UNDP.

<sup>6</sup> Power and Participation Research Centre, June 2010.

population as a share of the total population in the sampling framework is 20 per cent and not 27 per cent.

The 'slums' sample frame was the same as for the 2006 MICS and was based on the 2006 World Food Programme report, 'Study of Household Food Security in Urban Slum Areas of Bangladesh'. For the 2009 MICS, 134 clusters (probability proportional to size) in the slums were visited. In each cluster, at least 20 households were interviewed.

### *Slums*<sup>7</sup>

According to the 2005 Census of Urban Slums, the total slum population in the six largest cities of Bangladesh was 5.4 million compared to a total urban population of roughly 15.6 million. However, there is no typical slum; the differences among such settlements can be as significant as their commonalities. It is also the case that not all people who are poor live in slums.<sup>8</sup> Some estimates of the total slum population in 2010 are as high as 10 million. On the other hand, a World Bank study counted 1,925 slums in Dhaka comprising 275,000 households (1.5 million people). Because of several uncertainties, it is preferable to deal in ranges. The population of slums in 2008 was estimated at between six and seven million people, 30 per cent of the metropolitan population and about 15 per cent of the overall urban population. In other words, the population of slums is about 5 per cent of the total population or about 7 million people in 2010.

Characteristics of slums (from the 2005 Census of Urban Slums):

- Predominantly poor housing
- Very high population density and room crowding (more than 1,000 persons per acre)
- Very poor environmental services
- Very low socio-economic status for the majority of residents
- Lack of security of tenure (permanent threat of eviction)
- Poor governance

*Urban slums in Bangladesh grew much faster than the overall rate of urbanization. In most cases, slums lack even the most basic amenities associated with urban life, such as running water, sewage systems, latrines, waste disposal services and electricity. Slum dwellers also have restricted access to basic social services, such as health clinics and schools.*<sup>9</sup>

© UNICEF/2010/Ahsan Khan

<sup>7</sup> This report uses the term 'slum' for what can also be termed as 'informal settlement', 'squatter settlement', 'pavement dwellings' and 'shanties'.

<sup>8</sup> Power and Participation Research Centre, June 2010.

<sup>9</sup> Tavares-Goodman, February 2010.

## *Migration*

Migration is the main driver of urban growth. The main reasons for migration are:

- Economic; ‘push and pull factors’ (55 per cent)
- Environmental; mostly river erosion (27 per cent)
- Family (clan) reunification.<sup>10</sup> (10 per cent)

Migration is fuelled by extreme rural poverty, landlessness and large urban-rural wage differentials. Migrants flock to the cities in Bangladesh for the same universal reasons: in search of jobs (employment in services and industry) and better lives.<sup>11</sup>

Migrants normally end up in illegal settlements on precarious land with major environmental problems. These areas have few – usually low-quality – services, and rents offered are at high prices through middlemen (*mastaans*) effectively and conveniently positioned between huge demand for and limited offer of basic services. Slum evictions are a constant threat and occur without a clear resettlement plan.

© UNICEF/2009/Shehzad Noorani

*The level of services provided in slums is much lower than in most rural areas. Access to better services is almost never given as a reason for migration.*

## **A vicious circle**

Lack of tenure security is a key characteristic of informal urban settlements. Informal settlements are thus deprived of support and services from the formal public and non-public sectors. Some support comes from non-governmental organizations (NGOs) and the United Nations, but these agencies allocate the majority of funding for poverty alleviation to rural areas.

The insecurity of tenure and its implicit potential for politicization serve as deterrents when it comes to allocating funds for the urban poor (even for the Grameen Bank). The government perceives that granting tenure security would encourage more settlers and induce migration from rural areas. Thus, the lack of secure tenure perpetuates the downward spiral of poverty in slum areas.<sup>12</sup>

# Analysis of Data

## Urban-rural differentials

### *Differences in under-five mortality rates among selected Asian countries*

Bangladesh has the smallest difference in urban and rural under-five mortality rates (U5MR) among selected Asian countries, as shown in Table 1.

**Table 1:**  
Urban-rural differentials in the under-five mortality  
in selected Asian countries

<i>Per 1,000 live births</i>				<i>Ranked by differences</i>
	Total U5MR	Urban U5MR	Rural U5MR	Rural % higher
Bangladesh (2007)	74	63	77	22%
Bangladesh (2009)	64	53	66	25%
Pakistan (2007)	93	78	100	28%
Cambodia (2005)	106	76	111	46%
India (2007)	74	52	82	58%
Indonesia (2007)	51	38	60	58%
Philippines (2008)	37	28	46	64%
Nepal (2006)	79	47	84	79%

*Based upon DHS Stat-compiler and Bangladesh MICS 2009*

According to a recent publication “Achieving the MDG’s with Equity” the ratio of the under-five mortality rate, rural areas to urban areas is 1.5 on average in the developing countries and also in South Asia.

Bangladesh has the smallest difference between urban and rural under-five mortality rates (U5MR) among selected Asian countries, as shown in Table 1. Rural U5MR is 25% higher, a ratio of U5MR, rural areas to urban areas, is therefore of 1.25.

### *Differences in the composite deprivation index of urban and rural areas*

The same relationship between urban and rural area is found for Bangladesh when a composite deprivation index (CDI)<sup>13</sup> is used (Table 2).

<sup>13</sup> Composite deprivation index, based upon four indicators: net attendance ratio in secondary school, sanitation coverage, adult literacy and skilled attendance at birth.

**Table 2:**  
Comparisons of urban and rural areas by ranking in the composite deprivation index

	Total CDI	Urban CDI	Rural CDI	Rural % higher:
Bangladesh	55	45	58	29%

### *Urban-rural differences for MICS 2009 indicators*

When analysing the components of the CDI, the most obvious observation is the absence of any difference between urban and rural areas in access to improved sanitation (according to the definition used by the WHO/UNICEF Joint Monitoring Programme on Water Supply and Sanitation). This is due to the widespread use of shared facilities in urban areas, which is considered ‘unimproved’ sanitation according to the JMP. Other components of the CDI show substantial differences in relation to indicators such as skilled attendance at birth and literacy. However, there are no statistically significant differences for many indicators between urban and rural areas

**Table 3:**  
Urban-rural differences using MICS 2009 indicators for Bangladesh

Indicator	Urban	Rural
Skilled attendant at birth	45%	19%
Adult literacy (Women aged 15-49 years)	66%	48%
Net attendance ratio in secondary education	53%	48%
Gender parity index in secondary education	1.08	1.18
Comprehensive correct knowledge on HIV and AIDS	18%	13%
Youth literacy (Women aged 15-24 years)	77%	70%

**Table 4:**  
Urban-rural similarities using MICS 2009 indicators for Bangladesh

Indicator	Urban	Rural
Population using an improved sanitation facility	54%	54%
Breastfeeding within one hour of birth	50%	50%
Net attendance ratio in primary education	84%	81%
Gender parity in primary education	1.01	1.03
Net attendance ratio in secondary education - women	55%	52%
Drop out in primary education	1.2%	1.2%
Drop out in secondary education	3.5%	3.4%
Repetition rate in primary education	5%	5%
Access to improved drinking water	99%	97%
Birth registration	53%	54%
Child labor	3%	2%

This study suggests that urban-rural comparisons obscure the severe deprivation in urban slum areas and that the extent of deprivation in the latter partly explains why only minimal statistical differences exist between urban and rural areas.

## Social indicators performance in slums

### *Social indicators from MICS 2009*

Slums have the worst indicator values of all surveyed areas, sometimes dramatically so. Table 5 presents an overview.

**Table 5:**

Urban, rural and slum values for 12 indicators of the 2009 MICS in Bangladesh

Indicator	Urban	Rural	Slum	Slum worse than rural %
U5MR (per 1,000 live births)	53	66	95	44%
Skilled attendant at birth	45%	19%	15%	-21%
Population using an improved sanitation facility	54%	54%	9%	-83%
Net attendance ratio in pre-school education	26%	22%	13%	-41%
Net attendance ratio in primary education	84%	81%	65%	-20%
Pupils starting Grade 1 who reach Grade 5	80%	80%	48%	-40%
Drop out in primary education	1%	1%	8%	700%
Net attendance ratio in secondary education	53%	48%	18%	-63%
Youth literacy (women aged 15-24 years)	77%	70%	51%	-27%
Adult literacy (women aged 15-49 years)	66%	48%	35%	-27%
Gender parity index in secondary education	1.08	1.18	1.26	7%
Birth registration	53%	54%	28%	-48%

While the national average for net attendance in secondary education is 49 per cent (48 per cent in rural areas and 53 per cent in urban areas), it is only 18 per cent in slums.

Even an indicator such as initial breastfeeding (which shows no difference by geographic area or the education level of the mother, and is 50 per cent in both urban and rural areas), is lowest in slums (35 per cent). In addition:

- Slums have very high rates of school dropout and repetition, and an extremely poor ratio for gender parity in secondary school.
- Slums have three times more child labour (13 per cent, according to MICS 2006), than the national average.
- Slums have half the rate of birth registrations and half the rate of knowledge of HIV as compared to the national average.

In slums, crime and violence and a precarious housing situation (fires) combine to produce an environment of extreme deprivation and violation of basic rights.<sup>14</sup>

The MICS data correspond to those of the World Bank report:<sup>15</sup> Access to schools and health clinics is limited for the poor. Only 7.3 per cent of slums have a public health clinic and only 26 per cent have a government school. In the absence of public providers, some NGOs operate clinics and/or primary schools.

### *Trends in under-five mortality rates*

The under-five mortality rate in slums (95 per 1,000 live births) is almost double the urban rate (53 per 1,000 live births) and almost 50 per cent higher than the rural rate (66 per 1,000 live births). This suggests that conditions in the slums are very poor indeed.<sup>16</sup>

*This learning centre is well decorated (better than some government primary schools). Families, 25 students and one teacher share one toilet. It is small but clean.*

**Table 6:**  
Trends in under-five mortality rates in Bangladeshi slums, 1994-2007,  
Per 1,000 live births

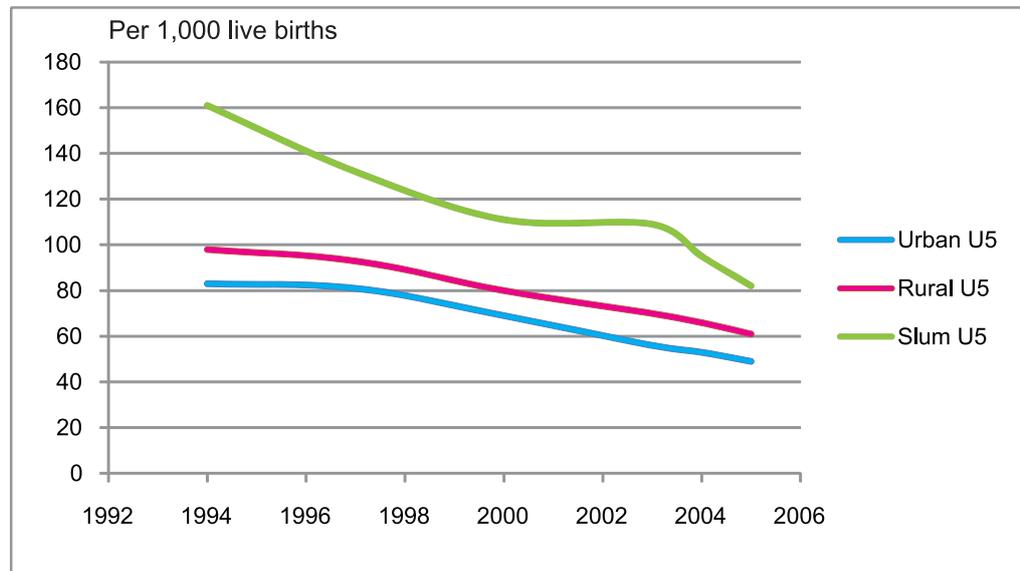

Year	Urban U5MR	Rural U5MR	Slum U5MR
1994	83	98	161
1997	81	93	132
2000	69	80	111
2003	56	70	109
2004	53	66	95
2005	49	61	82
2007	53	59	75

<sup>14</sup> World Bank, June 2007.

<sup>15</sup> Ibid.

<sup>16</sup> Mortality data in the 2009 MICS are derived using the indirect (or 'Brass') method. The most robust values of that method are numbers based on information from women aged 25-29 and 30-34 years, concerning the number of children born and the number who survive. That information, using a computer program (Qfive) and applying model West Life tables, gives an average estimate for a reference period of five years before the survey date (2004).

**Figure 1:**  
Under-five mortality rates in urban, rural and slum areas of Bangladesh,  
1994-2005

Several observations can be made from the data in Figure 1. First, it is apparent that urban and rural under-five mortality rates move in synchrony. Second, the U5MR in slums was stagnant at the beginning of the millennium, but has recently improved. Third, U5MR in slums has declined considerably over time, from 161 per 1,000 live births in 1994 to 82 per 1,000 live births in 2005. This implies that U5MR in slums was halved in 11 years.

This trend, however, must be treated with caution, keeping in mind the scale of rural to urban migration over this period.

### ***Trends in selected social indicators, 2006 and 2009***

The 2006 and 2009 MICS allowed for an analysis of development over time for some indicators:

**Table 7:**  
Trend in net attendance ratio in primary school, 2006 and 2009

	<b>2006</b>	<b>2009</b>
Urban	80.9%	83.9%
Rural	81.5%	80.8%
Slums	52.3%	65.1%

The data show that progress has been achieved in urban areas in terms of net attendance in primary school and that slums are catching up. For the poor, education costs can be prohibitive and there is little evidence that the state/government is investing in human capital (the development of slum dwellers) to boost overall social and economic development. The credit for this goes mainly to Bangladeshi NGOs who have stepped in and done a remarkable job.

*In many cases, economic growth has been accompanied by increased inequality, complicating the challenge of poverty reduction. High levels of inequality could undermine growth.*

*Policy makers should pay particular attention to income inequality, both for its own sake and because it strongly influences the “poverty reduction dividend” of growth. Social policy can be a powerful means by which to limit inequality in outcomes. (OECD 2010)*

Such progress is also reflected in youth literacy rates, as shown in Table 8.

**Table 8:**  
Trend in female youth literacy, 2006 and 2009

	2006	2009
Total	70.0%	72.0%
Urban	75.0%	77.0%
Rural	68.0%	70.0%
Slums	38.0%	52.0%

A low literacy level in slums normally reflects the background of migrants more than the situation in slums, but in Bangladesh it can be a combination of both factors. The poorest of the poor usually end up in slums, but the slums also offer few opportunities to address basic social-service deprivation.

Progress in health is lagging in slum areas.

**Table 9:**  
Trend in skilled birth attendance, 2006 and 2009

	2006	2009
Total	20.1%	24.4%
Urban	38.0%	45.0%
Rural	14.0%	19.0%
Slums	11.5%	15.0%

The proportion of births attended by a skilled health worker is low, although this result is masked by unclear definitions surrounding this indicator. No formal services exist in the slums (no doctors and nurses), but several health posts run by the Bangladesh Rural Advancement Committee (BRAC) are presently staffed with trained community health workers.

© UNICEF/2010/Ahsan Khan

*There are three maternal health-care centres supervised by BRAC in the Korail slum in Dhaka. The traditional birth attendant there reported about 20 births per month. She attended a 15-day initial training two years ago and attends a three-day refresher course every three months. She regularly receives delivery kits from BRAC. For pregnancies with potential risk, she refers the mother to the BRAC hospital. In the above photo, she demonstrates how she assists in a delivery. After a normal delivery, the mother and baby will stay in the centre for about six hours before returning home.*

**Table 10:**  
Trends in birth registration, 2006 and 2009

	2006	2009
Total	10%	54%
Slums	5%	28%

While birth registration overall has improved significantly between 2006 and 2009 (thanks in part to a nationwide campaign), coverage in the slums remains half the national figure.

However, for several important indicators (except skilled attendance at birth), we see that, even in the slums, some improvements are under way.

The statistics in Bangladesh suggest that urban slums are extremely marginalized, much more so than in other countries where slums still outperform rural areas in service delivery.

## Why coverage of basic social services in slums is low

The provision of social services in burgeoning urban areas is an enormous challenge in light of rapid population growth and limited physical space.

The absence of legal rights to land and threats of eviction also account for the absence of formal service provision. As a result, a parallel structure has emerged where free education and health is delivered through NGOs and where *mastaans* (middlemen) are providing other services (albeit illegally and for a high fee).

Thus, there are three major constraints when it comes to providing services in slums:

- The absence of an inclusive governmental urban development policy giving slum dwellers basic rights and access to social services
- The repeated eviction – or permanent threat of eviction – of slum residents
- The role of *mastaans* in the absence of formal government structures.

Access to health, education, power, water supply, sanitation and waste management is very limited for the urban poor. Where those services do exist, quality is low and the cost can be prohibitive. There is an urgent need to find sustainable and affordable solutions to meet the basic needs of this vulnerable portion of the population<sup>17</sup>. An inclusive policy framework for urbanization would be most helpful<sup>18</sup>.

According to the World Bank, two common perspectives among policy makers affect decision-making with regard to the urban poor:

- First, it is assumed that providing access to basic services will result in increased rural-urban migration.
- Second, it is generally thought that the urban population is better off than the rural population. Consequently, until recently, slums have received little attention from donors, NGOs and government agencies.

The World Bank offers a number of reasons why slum populations have less access to education:

- Inadequate or absent school facilities
- Distance to school
- High costs
- Problems getting children admitted
- Duties in caring for younger siblings
- Slum evictions
- High opportunity cost of education.

---

<sup>17</sup> Ahmed, K. Iftekhar, May 2007.

<sup>18</sup> Islam and Mustafa, January 2006.

*The discrepancy between attendance in primary and secondary schools is extremely large in slums. There are no informal schools at the secondary level, and in a slum such as Korail, only 7 out of 50 children can continue on to secondary school. The story of Manzil, who graduated from a learning centre but had to assist her father in managing his small shop in Korail, is typical of the plight of many slum children. Moreover, informal learning centres apply tough rules for continued access. Buni, a young girl living in Korail, was expelled from the centre since she could not regularly attend class. The reason for the low use of health services is that hospitals and clinics are typically not located close to slum areas and the waiting line is extremely long. Slum dwellers feel deprived and 'free' services often carry hidden costs.*

The pervasive role of *mastaans* is related to party politics as they are the ones that 'deliver the voters'. Thus, in Bangladesh, the lack of a government policy does not necessarily harm politics but can, as in other countries, support political parties. With the threat of eviction ever present, people are effectively held hostage by the *mastaans* and broader interests.

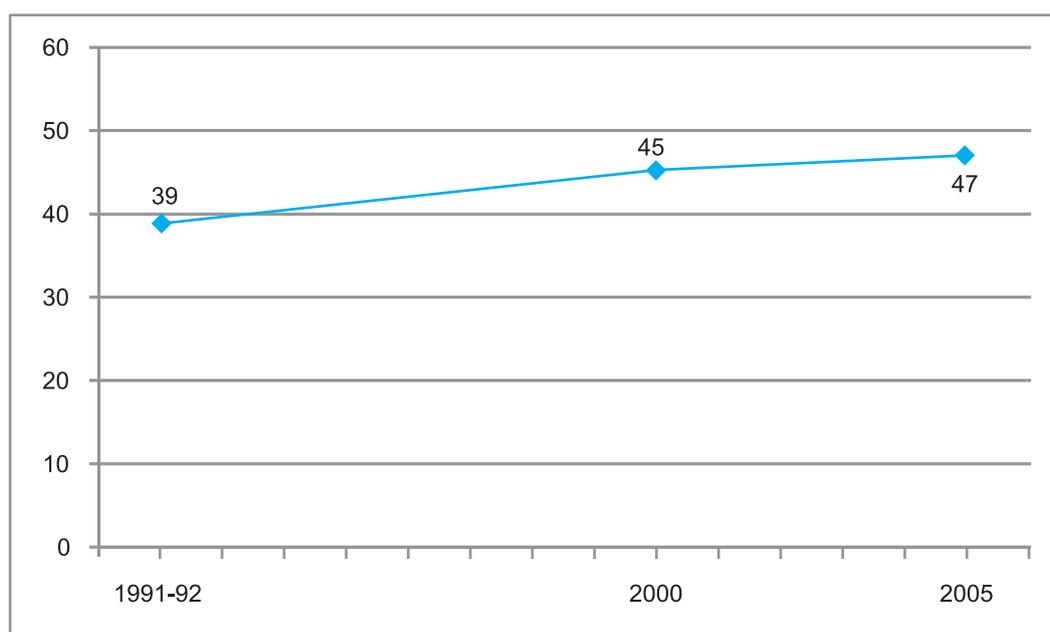

## **Two urban realities**

The data show that when four individual city slum populations and six city corporation populations are included in the analysis and ranked by means of the composite deprivation index, all the slums fall into the 'most deprived' category, with Dhaka slums being one of the ten worst-performing geographic areas. All city corporations were in the top 35 best-performing areas, a graphic illustration of the fact that urban areas include two completely separate realities. Slums are generally performing worse than rural areas, but a few upazilas have even lower social indicators than the slums.

## Equitable Urbanization

There is no doubt that economic growth is necessary for improving human development in terms of reducing poverty and increasing the availability of resources for investment (Anand and Ravallion. 1993). Bangladesh's performance in this respect has been impressive in recent years, but at the same time the Gini coefficient (or economic inequality) has been rising as shown in Figure 2.

**Figure 2:**  
Gini index trend in Bangladesh, 1990-2005

**Source:** Household Income and Expenditure Survey 2000 and 2005

The experience from Brazil, China and India has shown that poverty reduction is more dependent on inequality reduction than economic growth (Ravallion. 2010) and thus, perhaps Bangladesh can afford to grow at a slower economic pace while effectively dealing with inequity. Despite significantly higher GDP growth per capita in both China and India, Brazil's poverty reduction rate relative to GDP growth per capita has been five times higher than that of China and 11 times higher than that of India as shown in Tables 11 and 12 (Ibid).

**Table 11:**  
Growth rates in Brazil, China and India: 1981 - 2005

	Brazil	China	India
GDP per capita (%)	0.8	8.8	3.9

**Table 12:**  
Poverty reduction rates in Brazil, China and India: 1981 - 2005

	Brazil	China	India
Poverty reduction (%)	3.2	6.6	1.5

According to Ravallion (2010), the reason for Brazil’s better performance is to do with a decreasing Gini coefficient and social inequalities as compared to China and India (Table 13) during their respective reform periods (1993-2005 for Brazil and India; and 1981-2005 for China).

**Table 13:**  
Gini index trends in Brazil, China and India: 1993 and 2005

	Brazil		China		India	
	1993	2005	1993	2005	1993	2005
Gini index (%)	59.7	57.6	35.5	41.5	30.8	33.4

In 2010, the estimated per capita income in Bangladesh was USD750 per year.<sup>19</sup> Given that the estimated population of Bangladesh is approximately 150 million, GDP amounts to some USD112.5 billion.

The current estimated urban population as a share of the total population is 27 per cent (2008), or 41 million people. It is estimated that 50 per cent of GDP is contributed by those who live in urban areas.<sup>20</sup> This amounts to USD56.3 billion or USD1,370 per capita/year.

Assuming a current average annual income of USD750 per capita for slum dwellers and given that the latter comprise approximately 18 per cent of the urban population, this implies some 7.3 million people contributing in the order of USD 5.5 billion annually to the GDP.

The non-slum urban population comprise approximately 33.2 million and contribute some USD 46.1 billion annually to the GDP (USD1,390 per capita/year).

The rural population is currently earning about USD515 per capita annually (USD56.3 billion/109.5 million people), and will have to quadruple its income during the next decade to achieve the “Vision 2021”<sup>21</sup> average annual income of USD2000 per capita. It will not be easy to materialize this objective. Nor will it be easy for the urban slum dwellers to almost triple their income over the same period.

This challenge calls for serious urban development, not just in the six city corporations but also in at least some selected municipalities. Much greater decentralization of urban growth, with fiscal disincentives in the large cities and incentives in selected municipalities may have to be considered to move industries (and jobs) to rural areas. Adequate infrastructure investments and development, particularly outside the major cities, as well as an inclusive strategy for urban slum dwellers is needed.

“Vision 2021” targets may not be met if the disparities between slum dwellers and the non-slum dwellers living in cities are allowed to follow the current trend and continue to increase. Such a development is undesirable, not only from a human rights perspective, but also because it could lead to social unrest. It is, therefore, critically necessary to incorporate slum-dwellers into urban development strategies.

*Slum dwellers are hardworking people that moved to the cities in search of a better life. They did not move to cities because of better services. Their children – as all children in Bangladesh – have the right to be treated as full-fledged citizens and more effort should therefore be made to deliver education, water, sanitation and health services to all urban slum dwellers.*

There is simply no way to halt or reverse the natural trend towards urbanization. This is a well known fact that some Bangladeshi policy makers have difficulties to accept. Urbanization will continue to occur as more people reach middle-income status. Furthermore, urbanization is necessary to the realization of “Vision 2021”. Taking lessons from other countries, such as Brazil,<sup>22</sup> Bangladesh should consider this trend as positive and act proactively so that the large productive population living in slums can better contribute towards the acceleration of economic growth – instead of becoming a social and economic burden.

In order to further mitigate the unfounded fear of government officials that human development investments in slums will act as a pull factor for urbanization, the sixth Five-Year National Development Plan could simultaneously incorporate a socio-economically inclusive urban development strategy along with substantially improved targeting of human development and economic opportunities towards the most deprived rural districts and *upazilas*. Such a holistic approach would assist Bangladesh in achieving the Millennium Development Goals *with equity* as well as the realization of “Vision 2021”.
