

3rd INTERNATIONAL CHILDREN'S WORLD WATER FORUM

This declaration was developed by 150 children from 21 countries and shared with the World Leaders

- Water must be protected and used consciously.
- There are different phases about this. Firstly people should be educated.
- We can build filters to clean the water.
- Industrial wastes should not be thrown to water resources.
- Create systems to collect rain water. Use that in our toilets and we won't have to purify it and waste the rainwater.
- Improving technology involved in use of purifying and collecting water.
- Transferring technology within nations.
- Funds relating to the subject should be increased so the technology can be improved.
- Highways and the roads that each country has can contain drains and when rain goes down the water will go to the water and water can be distributed to the houses.
- Without water recycle, plants and animals will be affected.
- Every individual must have their right to access to the clean water.
- Some countries in the world should not keep the water to themselves totally and share it.

There should be an international framework on the division of water.

- Limit the usage of underground water.
- The infrastructure of old cities must be improved.
- An action should be taken in order to decrease global warming. For example; Drive less, use public transportation, recycle, reuse, decrease the usage of substances that cause greenhouse effect and focus on the other sources of energy such as wind and solar and increase the usage of substantial energy. Think about the future, not just the present.
- Building of an international independent and non-governmental framework (for example U.N.) for water problems.
- Children should be taken into consideration because children's ideas are not taken seriously. Children should be given authority to conduct projects. Government and local authorities keep their egos down. There may be international funds to support children's ideas and projects.
- Deforestation can be stopped.
- Wells cause the damage in agricultural fields. The wells should be made more responsibly.
- We have to publicize that we don't have much water in the world and we should pay attention to children's projects. Advertise children's projects.
- Agricultural technologies must be developed and increased, for example drop system.
- We should hold national children forums.
- Production of dam should be decreased.
- Filtrating the chemicals released from the factories would save the water. People should be kept aware of the situation.
- Underground water should be researched more.

- Should water prices in developed countries be increased in order to supply water to undeveloped countries?
