LIST OF ABBREVIATIONS	xix
MESSAGE	xx
MESSAGE	xxii
FOREWORD	xxiv
PREFACE	xxvi
MESSAGE	xxviii
ACKNOWLEDGEMENT	xxx
EXECUTIVE SUMMARY	xxxiii
1. INTRODUCTION	1
1.1 Background	1
1.2 Survey Objectives	2
1.3 Scope of the Survey	2
2. SURVEY METHODOLOGY	5
2.1 Sample Design	5
2.2 Sample Size	5
2.3 Sample Allocation	6
Table SM 2.1: The allocation of sample households and clusters within each of the eight divisions, Survey of Children's Education in Bangladesh, 2021.....	6
2.4 Listing Activities and Selection of Households	6
2.5 Data Collection Method	6
2.6 Training	7
2.7 Fieldwork	7
2.8 Fieldwork Quality Control Measures	7
2.9 Data Management, Editing and Analysis	7
2.10 Data Tables	8
2.11 Survey Findings	8
2.12 Questionnaire	8
2.13 Ethical Protocol	9
3. SAMPLE COVERAGE AND CHARACTERISTICS OF RESPONDENTS	11
3.1 Results of interview	11
Table SR.1.1: Results of households, girls and women age 10-24's and children age 5-17's interviews	11

3.2 Housing and household characteristics	11
Table SR.2.1: Housing characteristics	13
Table SR.2.2: Household and personal assets.....	14
3.3 Household composition	15
Table SR.3.1: Household composition Percent and frequency distribution of households by selected characteristics, Bangladesh, 2021	15
3.4 Age structure of household population	16
Table SR.4.1: Age distribution of household population by sex Percent and frequency distribution of the household population by five-year age groups, dependency age groups, and by child (age 0-17 years) and adult populations (age 18 or more), by sex, Bangladesh, 2021	17
3.5. Household wealth index quintiles	17
Table HC.5.1: Wealth quintiles Percent distribution of the household population by wealth index quintile, according to area of residence and division, Bangladesh, 2021	17
3.6 Sanitation	18
Table WS.6.1: Use of improved and unimproved sanitation facilities Percent distribution of household population according to type of sanitation facility used, Bangladesh, 2021	19
Table WS.6.2: Sharing of sanitation facilities Percent distribution of household population by use of shared facilities by users of improved and unimproved sanitation facilities, Bangladesh, 2021	20
Figure WS.1: Access to sanitation facility in the household by area and division, Bangladesh, 2021	21
4. LEARN	23
4.1 School readiness and attendance	23
Table LN.1.1: School readiness Percentage of children attending first grade of primary school who attended pre-school the previous year, Bangladesh 2021	25
Table LN.1.2: Primary school entry Percentage of children of primary school entry age entering grade 1 (net intake rate), Bangladesh, 2021.....	26
Table LN.1.3: Primary school attendance and out of school children Percentage of children of primary school age attending primary or lower secondary school (adjusted net attendance ratio), percentage attending early childhood education, and percentage out of school, Bangladesh, 2021	27
Richest.....	28
Table LN.1.4: Lower secondary school attendance and out of school children Percentage of children of secondary school age attending lower secondary school or higher (adjusted net attendance ratio), percentage attending primary school, and percentage out of school, Bangladesh, 2021	29
Table LN.1.5: Age for grade Percentage of children attending primary and lower secondary school who underage, at age and overage for grade, Bangladesh, 2021	31
Table LN.1.6: Upper secondary school attendance and out of school children Percentage of children of upper secondary school age attending upper secondary school or higher (adjusted net attendance ratio), percentage attending lower secondary school, and percentage out of school.	33
Figure LN.1: Net attendance ratios, attendance in primary, lower and upper secondary schools and out of school children by level of education, Bangladesh, 2021.....	35
Table LN.1.7: Gross intake, completion and effective transition rates	37
Figure LN.2: Education indicators by sex, Bangladesh, 2021	39

Table LN.1.8: Parity indices Adjusted net attendance ratios of girls to boys, in primary, lower secondary and upper secondary school, Bangladesh, 2019	40
4.2 Support for child learning at school and learning environment at home	42
Table LN.2.1: Support for child learning at school and learning environment at home Percentage of children age 7-14 years attending school, who read or are read to at home, whose teachers use the language also spoken at home among children who attend school, Bangladesh, 2021	43
4.3 Foundational learning skill	44
Table LN.3.1: Foundational reading skills Percentage of children age 7-14 years who demonstrate foundational reading skills by successfully completing three foundational reading tasks in Bangla, by sex, Bangladesh, 2021	47
Table LN.3.1A: Foundational reading skills by gender parity Percentage of children aged 7-14 years who demonstrate foundational reading skills by successfully completing three foundational reading tasks in Bangla, by gender parity (girls to boys), Bangladesh, 2021	51
Figure LN.3: Foundational reading skills of children age 7-14 years by sex and area, Bangladesh, 2021	53
Table LN.3.2: Foundational numeracy skills Percentage of children aged 7-14 years who demonstrate foundational numeracy skills by successfully completing four foundational numeracy tasks, by sex, Bangladesh, 2021	54
Table LN.3.2A: Foundational numeracy skills by gender parity Percentage of children aged 7-14 years who demonstrate foundational numeracy skills by successfully completing four foundational numeracy tasks, by gender parity (girls to boys), Bangladesh, 2021	58
Figure LN.4: Foundational numeracy skills of children age 7-14 years by sex, area and skill types	59
(in %), Bangladesh, 2021	59
4.4 Drop-out and repetition	60
Table LN.4.1: Primary, lower and upper secondary aged children drop-out.....	62
Percentage of primary, lower and upper secondary aged children attending a given grade in a given school-year prior to the survey who are no longer attending school in the survey year, Bangladesh, 2021 Drop-out rates of girls to boys (GPI), in primary, lower and upper secondary school, and additional parity indices for all children irrespective of the level of education, Bangladesh, 2021	62
Table LN.4.2: Grade-specific drop-out	64
Grade specific drop-out rates among children of primary, lower secondary and upper secondary school, Bangladesh, 2021.....	64
Table LN.4.3: Repetition of primary, lower secondary and upper secondary aged children ..	66
Percentage of primary, lower and upper secondary school going children in a given grade who repeated the following-year; Repetition rates of girls to boys (GPI), in primary, lower and upper secondary school, and additional parity indices taking all children, Bangladesh, 2021	66
Table LN.4.4: Grade specific repetition	68
Grade-specific repetition rates among children of primary, lower secondary, upper secondary and higher levels of school, Bangladesh, 2021	68
4.5 Learning online during school closure	70
Table LN.5.1: Online education during school closure due to COVID-19 Percentage of primary, lower secondary and upper secondary school age children who participated in online learning during school closure and average study time by education level, Bangladesh, 2021	74
Table LN.5.2: Scope of using devices for online learning	77

Percentage of children by scope of using devices for online learning during school closure (for COVID-19), Bangladesh, 2021	77
Table LN.5.3: Mean study time per day before and during school closure of primary, lower-secondary and upper-secondary school age children Primary, lower-secondary and upper-secondary school age children's average learning time (in minute) per day before and during the closure of school, per level of education, Bangladesh, 2021	79
Table LN.5.4: Study time at home.....	84
Percentage of primary, lower secondary and upper secondary school age children who studied at home before and during school closure due to COVID-19 and after reopening of school, children's mean study time per day (in minute) at home before and during school closure and after reopening of school, Bangladesh, 2021.....	84
Table LN.5.5: Study time at school.....	85
Percentage of primary, lower secondary and upper secondary school age children who studied at school before and during school closure due to COVID-19 and after reopening of school, children's mean study time per day (in minute) at school before and during school closure and after reopening of school, Bangladesh, 2021.....	85
Table LN.5.6: Study time at coaching.....	86
Percentage of primary, lower secondary and upper secondary school age children who studied at coaching centre before and during school closure due to COVID-19 and after reopening of school, children's mean study time at coaching before and during school closure and after reopening of school, Bangladesh, 2021	86
Table LN.5.7: Reasons for not being able to take education through online/radio/television during school closure for COVID-19 Percentage of children not attending online study according to reasons, by level of education, Bangladesh, 2021	89
Table LN.5.8: Reasons for not going to any educational institution for the academic year 2021	93
Percentage of children according to reasons for not going to any educational institution for the academic year 2021 by area, child education and household wealth quintile (Multiple responses), Bangladesh, 2021	93
Figure LN.5: Reasons for not going to any educational institution for the academic year 2021 by area, Bangladesh, 2021	93
Table LN.5.9: Measures taken by households and schools to fill loss of study during school closure due to COVID-19 by level of education Percentage of children who got benefited from measures taken by their households and schools to fill learning loss during school closure, by level of education, Bangladesh, 2021.....	94
Table LN.5.10: Perception of parents about online study during school closure Percentage of school going children by parents' perception of children's study online during school closure due to COVID-19, by education level, Bangladesh, 2021	100
Table LN.5.11: Measures to continue attendance in educational institutions	104
Percentage of school going children or their mothers/caregivers by opinion on measures that could be taken to continue children's attendance in educational institutions in the 2021 school year, Survey on Children's Education in Bangladesh 2021	104
Table LN.5.12: Feeling loneliness during school closure	105
Percentage of 5-24 years children and youth who felt loneliness during school closure for COVID-19, Bangladesh, 2021	105
Table LN.5.13: Feeling nervousness during school closure	106
Percentage of 5-24 years children and youth who feel nervousness/anxiety during school closure for COVID-19, Bangladesh, 2021.....	106
Table LN.5.14 Feeling worried during school closure.....	107

Percentage of 5-24 years children and youth who feel worried during school closure for COVID-19, Bangladesh, 2021	107
Table LN.5.15: Feeling depressed during school closure	108
Percentage of 5-24 years children and youth who feel depressed during school closure for COVID-19, Bangladesh,2021	108
Table LN.5.16: Feeling inferiority complex during school closure.....	109
Percentage of 5-24 years children and youth who feel Inferiority complex during school closure due to COVID-19, Bangladesh, 2021	109
Table LN.5.17: Feeling irritated during school closure	110
Percentage of 5-24 years children and youth who feel Irritated during school closure due to COVID-19, Bangladesh, 2021	110
Table LN.5.18: Feeling over-pressure of homework during school closure	111
Percentage of 5-24 years children and youth who feel over-pressure of homework during school closure for COVID-19, Bangladesh, 2021	111
5. Protected from violence and exploitation	113
5.1. Child discipline	113
Table PR.1.1: Child discipline Percentage of children age 5-14 years by child disciplining methods experienced during the last one-month preceding the survey, Bangladesh, 2021	114
Table PR.1.2: Attitude towards physical punishment Percentage of mothers/caretakers of children age 5-14 years who believe that physical punishment is needed to bring up, raise, or educate a child properly, Bangladesh, 2021	115
Table SPR.2.1W: Child marriage	117
Percentage of women age 15-24 years got married by different age groups and cause(s) of marriage, Bangladesh, 2021.....	117
6. Equitable chance in life	121
Table EQ.1.1: Functional difficulty in at least one domain Percentage of children age 5-17 years who have functional difficulty in at least one domain of functional difficulties, Bangladesh, 2021	122
Table EQ.1.2: Use of assistive devices Percentage of children age 5-17 years who use assistive devices and have functional difficulty within domain of assistive devices, Bangladesh, 2021	123
Appendix	124

SUMMARY TABLE OF SURVEY IMPLEMENTATION AND THE SURVEY POPULATION, SURVEY ON CHILDREN'S EDUCATION IN BANGLADESH, 2021

Survey implementation		Questionnaire: Household questionnaire	
Sample frame: Bangladesh Population and Housing Census 2011		Field work: December 2021 - January 2022	
Interviewer training: December 2021			
Survey sample		3. Children age 5-17 years	
1. Households		- Eligible	9,415
- Sampled	9,000	- Interviewed	9,384
- Occupied	8,996	- Response rate (percent)	99.7
- Interviewed	8,995		
- Response rate (percent)	99.9		
2. Girls and women age 10-24 years			
- Eligible for interviews	5,333		
- Interviewed	5,318		
- Response rate (percent)	99.7		
Survey Population		Percentage of population living in	
Average household size	4.2	- Urban areas	23.0
Percentage of population under:		- Rural areas	77.0
- 5 years	9.5		
- 18 years	33.7	- Barishal	5.8
		- Chattogram	17.6
Total population (no. of household members)	37,935	- Dhaka	25.4
Urban population	8,735	- Khulna	11.6
Rural population	29,200	- Mymensingh	7.5
Male population	18,841	- Rajshahi	14.3
Female population	19,094	- Rangpur	11.9
		- Sylhet	5.9
Housing characteristics		Household or personal assets	
Percentage of households with		Percentage of households owning:	
- Electricity	98.4	- A television	48.9
- Improved sanitation	88.7	- A refrigerator	44.4
		- Agricultural land	39.5
		- Farm animals/livestock	60.5
Mean no. of persons per room used for sleeping	2.3	Percentage of households where at least a member owns or has a	
		- Mobile phone	96.0
		- Bank account	38.5

SUMMARY TABLE OF KEY FINDINGS

MICS INDICATOR		SDG ¹	Module ²	Definition ³	Value
SAMPLE COVERAGE AND CHARACTERISTICS OF THE RESPONDENTS					
SR.1	Access to electricity	7.1.1	HC	Percentage of household members with access to electricity	98.7
SR.2	Households with a radio		HC	Percentage of households that have a radio	0.6
SR.3	Households with a television		HC	Percentage of households that have a television	48.9
SR.4	Households with a telephone		HC – MT	Percentage of households that have a telephone (fixed line or mobile phone)	96.4
SR.5	Households with a computer		HC	Percentage of households that have a computer	7.0
SR.6	Households with internet		HC	Percentage of households that have access to the internet by any device from home	49.0
SR.7	Household size		HC	Average number of household members	4.2
SR.8	Sleeping per room		HC	Mean number of persons per room used for sleeping	2.3
SR.9	Under-18 population		HC	Proportion of population aged below 18 years	33.7
SR.10	Use of improved sanitation facilities	3.8.1	WS	Percentage of household members using improved sanitation facilities	88.7
SR.11	Use of basic sanitation services	1.4.1 & 6.2.1	WS	Percentage of household members using improved sanitation facilities which are not shared	71.2

¹ Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. MICS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by MICS. The latter cases are included here as long as the current international methodology allows for only the way that the MICS indicator is defined, and/or a significant part of the SDG indicator can be generated by the MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>

² Refers to the modules in the MICS questionnaire. Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

³ All MICS indicators are disaggregated, where relevant, by wealth quintile, sex, age, ethnicity, functional difficulty and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

MICS INDICATOR	SDG	Module	Description	Value
EDUCATION				
LN.1			ED Percentage of children attending the first grade of primary school who attended early childhood education programme during the previous school year	75.0
LN.2			ED Percentage of children of school-entry age who enter the first grade of primary school	56.7
LN.3a LN.3b LN.3c			ED Percentage of children of (a) primary school age currently attending primary or secondary school (b) lower secondary school age currently attending lower secondary school or higher (c) upper secondary school age currently attending upper secondary school or higher	a. 80.5 b. 59.6 c. 50.5
LN.4a LN.4b LN.4c			ED Percentage of children of (Oos) (a) primary school age who are not attending primary or lower secondary school (b) lower secondary school age who are not attending primary school, lower or upper secondary school or higher (c) upper secondary school age who are not attending primary school, lower or upper secondary school or higher Percentage of children of (DoR) (reference year used for the survey) (a) primary school age children who were enrolled in school in 2020 but no longer attended school (dropped out) in 2021 (b) lower secondary school-age children who were enrolled in school in 2020 but no longer attended school (dropped out) in 2021 (c) upper secondary school-age children who were enrolled in school in 2020 but no longer attended school (dropped out) in 2021	a. 15.4 b. 15.7 c. 34.2 a. 3.1 b. 5.0 c. 7.1
LN.5a LN.5b			ED Percentage of children attending the last grade for the first time to children at appropriate age to the last grade (a) Primary school (b) Lower secondary school	a. 88.7 b. 83.6
LN.6a LN.6b LN.6c	4.1.2		ED Percentage of children or young people aged 3-5 years above the intended age for the last grade who have completed that grade (a) Primary school (b) Lower secondary school (c) Upper secondary school	a. 78.2 b. 64.1 c. 20.2
LN.7			ED Percentage of children attending the last grade of primary school during the previous school year who are not repeating the last grade of primary school and in the first grade of lower secondary school during the current school year	94.1
LN.8a LN.8b			ED Percentage of students attending in each grade who are 2 or more years older than the official school age for grade (a) Primary school (b) Lower secondary school	a. 8.2 b. 11.5

MICS INDICATOR		SDG	Module	Description	Value
LN.9a LN.9b LN.9c LN.9d	Education Parity Indices i. Gender ii. Wealth iii. Area iv. Functioning	4.5.1	ED	Net attendance ratio (adjusted) for girls divided by net attendance ratio (adjusted) for boys (a) Primary school (b) Lower secondary school (c) Upper secondary school	a. 1.11 b. 1.35 c. 1.14
				Net attendance ratio (adjusted) for the poorest quintile divided by net attendance ratio (adjusted) for the richest quintile (a) Primary school (b) Lower secondary school (c) Upper secondary school	a. 0.89 b. 0.50 c. 0.42
				Net attendance ratio (adjusted) for rural residents divided by net attendance ratio (adjusted) for urban residents (a) Primary school (b) Lower secondary school (c) Upper secondary school	a. 1.01 b. 0.96 c. 0.86
				Foundational learning skill for girls divided by foundational learning skills for boys (a) reading (age 7-14 years) (b) numeracy (age 7-14 years)	a. 1.13 b. 1.03
				Foundational learning skill for children in the poorest quintile divided by foundational learning skills for the richest quintile (a) reading (age 7-14 years) (b) numeracy (age 7-14 years)	a. 0.53 b. 0.52
				Foundational learning skill for children in rural residents divided by foundational learning skills for urban residents (a) reading (age 7-14 years) (b) numeracy (age 7-14 years)	a. 0.84 b. 0.88
				Foundational learning skill for children with functional difficulties divided by foundation learning skills for children without functional difficulties (a) reading (age 7-14 years) (b) numeracy (age 7-14 years)	a. 0.76 b. 0.69
				LN.10	Reading habit at home
LN.11	School and home languages		FL	Percentage of children aged 7-14 years attending school whose home language is used at school	95.8

MICS INDICATOR		SDG	Module	Description	Value
LN.12a LN.12b LN.12c	Children with foundational reading and number skills	4.1.1	FL	Percentage of children who successfully completed three foundational reading tasks ⁴ (a) Age 7-14 (b) Age for grade 2/3 (c) Attending grade 2/3 Percentage of children who successfully completed four foundational number tasks ⁵ (a) Age 7-14 (b) Age for grade 2/3 (c) Attending grade 2/3	a. 49.8 b. 28.8 c. 30.2 a. 25.8 b. 13.2 c. 15.3

MICS INDICATOR		SDG	Module	Description	Value
PROTECTED FROM VIOLENCE AND EXPLOITATION					
PR.2	Violent discipline		UCD – FCD	Percentage of children age 5-14 years who experienced any physical punishment and/or psychological aggression by caregivers in the past one month	76.6
PR.4a PR.4b	Early Marriage ^[M]	5.3.1	MA	Percentage of women age 20-24 years who were first married or in marital union (a) before age 15 (b) before age 18	a. 11.2 b. 40.7
PR.5	Young women age 15-19 years currently married or in marital union ^[M]		MA	Percentage of women age 15-19 years who are married or in marital union	33.1

MICS INDICATOR		SDG	Module	Description	Value
EQUITABLE CHANCE IN LIFE					
EQ.1	Children with functional difficulty		UCF – FCF	Percentage of children aged 5-17 reported with functional difficulty in at least one domain	4.2
EQ.1	Children wear glasses		UCF – FCF	Percentage of children aged 5-17 who wear glasses	2.3
EQ.1	Children use hearing aid		UCF – FCF	Percentage of children aged 5-17 who use hearing aid	0.5
EQ.1	Children use equipment or receive assistance for walking		UCF – FCF	Percentage of children aged 5-17 who use equipment or receive assistance for walking	0.4
EQ.1	Children with difficulty seeing when wearing glasses		UCF – FCF	Percentage of children aged 5-17 with difficulty seeing when wearing glasses	2.7
EQ.1	Children with difficulty hearing when using hearing aid		UCF – FCF	Percentage of children aged 5-17 with difficulty hearing when using hearing aid	6.9

⁴ Correctly reading 90% of words in a story, answering comprehension questions and demonstrating foundational reading skills

⁵ Number reading, number discrimination, addition, and pattern recognition and completion

MICS INDICATOR		SDG	Module	Description	Value
EQ.1	Children with difficulty walking when using equipment or receiving assistance		UCF – FCF	Percentage of children aged 5-17 with difficulty walking when using equipment or receiving assistance	28.8
LEARNING ONLINE DURING SCHOOL CLOSURE DUE TO COVID-19					
	Online learning during the school closure due to COVID-19			Percentages of primary, lower secondary and upper secondary school age children who participated in online learning during school closure (regardless of education level)	18.7
				Percentage of children with presence of any device in household to assist with online learning	36.9
				Percentage of children who had scope of using devices for online learning, i.e., how frequent have chances to use; (they have own devices or other's devices which they can use):	
				(a) Regularly	(a) 30.3
				(b) Occasionally	(b) 10.5
			(c) Rarely	(c) 4.6	
			(d) Not at all	(d) 4.3	
			(e) No scope of using devices (either for not having own devices or for other's devices without scope of use)	(e) 50.3	
				Percentage of children who had participated in online learning (including TV) (i.e., who have already used devices available to them; this is among those who have chances/scope of using devices):	
				(a) Always	(a) 57.7
				(b) Occasionally	(b) 22.1
				(c) Very little	(c) 10.3
				(d) Not at all	(d) 9.9
				Average online learning time (in minute) per day (only among those who attended online learning)	177.1
	Children's mean study time (in minute) per day before the school closure			Primary, lower secondary and upper secondary school age children's mean study time (in minute) every day <u>before</u> the school closure due to COVID-19 (regardless of education level):	
				(a) At home	(a) 127.1
				(b) At school	(b) 190.0
				(c) At coaching centre	(c) 46.1
				(d) Total (overall)	(d) 363.3
	Children's mean study time (in minute) per day after the school closure			Primary, lower secondary and upper secondary school age children's overall mean study time (in minute) every day at home or online or coaching centre <u>during</u> the school closure due to COVID-19 (regardless of education level) among all school going children irrespective of attending online learning or not):	
				(a) At home	(a) 83.4
				(b) At school (through online learning)	(b) 13.3
				(c) At coaching centre	(c) 26.8
				(d) Total (overall)	(d) 123.6
	Children studied at home before and during the school closure for COVID-19 and after reopening of school			Percentages of primary, lower secondary and upper secondary school age children who studied <u>at home before or after class time</u> - before, during the school closure and after reopening of school (regardless of education level):	
				(a) Before the school closure	(a) 95.5
				(b) During the school closure	(b) 80.8
				(c) After reopening of school	(c) 90.8

MICS INDICATOR	SDG	Module	Description	Value
			<p>Mean study time (minute/day) of primary, lower secondary and upper secondary school age children who studied <u>at home before or after class time</u> - before, during school closure and after reopening of school (regardless of education level):</p> <p>(a) Before the school closure (b) During the school closure (c) After reopening of school</p>	<p>(a) 117.5 (b) 85.8 (c) 111.3</p>

MESSAGE

I would like to congratulate the Bangladesh Bureau of Statistics (BBS) for conducting the 'Survey on Children's education in Bangladesh 2021'. In the Constitution of the Peoples' Republic of Bangladesh, Article 28(4) particularly emphasizes in making specific provisions concerning the advancement of the children.

Ensuring child rights, the Government has been carrying and active in building up honest, patriotic and able future generation through ensuring comprehensive development and preservation of child rights. As such, the demand for and use of statistical information for evidence-based policy and decision making is essential. Monitoring changes at household and individual level through household surveys has, therefore, become more important now than ever before.

During COVID-19 pandemic, the Government declared nationwide closures of all educational institutions for 18 months and established a remote learning system to ensure learning continuity. The 'Survey on Children's education in Bangladesh 2021' would help to understand the extent of the impact of the prolonged school closure during COVID-19 pandemic on attendances, out-of-school, drop-out, and learning loss of children, along with other education outcomes and support the government to take steps for improving the quality and standard of education.

I place on record my appreciation to Secretary, Statistics and Informatics Division and Director General, Bangladesh Bureau of Statistics for their efforts to make the survey success. I would like to thank the long-standing partner UNICEF for supporting the execution of the survey.

I hope this report will be useful for planners, policy makers, academicians and researchers.

M. A. Mannan MP

MESSAGE

I am delighted to know that the Bangladesh Bureau of Statistics has conducted the 'Survey on Children's Education in Bangladesh 2021' in collaboration with UNICEF Bangladesh. The survey has been initiated to generate important statistics related to education in the country that may have been impacted due to the prolonged closure of educational institutions during COVID-19.

Since its start in early 2020, COVID-19 has left its footprint on human lives worldwide, causing the deaths and sufferings of so many and the decline of the economies of the countries, decreasing income, limiting movement, and hampering normal life, Bangladesh is no exception to that. Children, after all, are the most vulnerable group, and disruptions in the country's education system will have a long-term impact on their livelihood in the coming years.

Even though the government of Bangladesh had to close all educational institutions immediately during COVID-19 to limit the spread of the virus, it has taken the necessary alternative steps to continue education in order to minimize education losses. The initiative includes, home visits by teachers to provide assignments to students and follow-up, remote learning sessions through TV and radio, online classes, and tutorials. Besides government initiatives, private institutions have also taken up effective measures for remote learning. In this regard, we must acknowledge the country's achievement in connecting most of its population by providing necessary digital platforms.

The report presents important key indicators of education which will help to address the impact of COVID-19 on children's learning and offer extra support if necessary. The survey also presents significant measures taken by the government, schools, and families as well. The survey findings will work as comprehensive data source to take action required curbing learning disruptions due to COVID-19 situation.

I would like to thank the Secretary, Statistics and Informatics Division, and the Director General of the Bangladesh Bureau of Statistics for providing guidance for the successful completion of the survey. I greatly appreciate the collaboration of UNICEF Bangladesh, a long-standing partner of BBS, in accomplishing the survey.

I hope the findings of the report will be useful for planners, policymakers, academicians, researchers, and program implementing authorities for making decisions in their respective areas.

Dr. Shamsul Alam

FOREWORD

I am very pleased to be associated with Bangladesh Bureau of Statistics (BBS) on publishing the report of the 'Survey on Children's education in Bangladesh 2021' which is both innovative and informative relating to children education. This household survey generates quality statistics on a few selected key indicators of the educational status of children: including drop-out rate, foundational literacy and numeracy skills at primary and secondary education levels in the year of 2021.

It is education that can develop the nations's qualities and skills. Ensuring education for all children is a fundamental issue. This survey was conducted in 2021 which would enable to assess the impact of the school closure during COVID-19 pandemic on children's education. The findings of the survey would provide important information to the stakeholders and the persons who are involved in implementing education programme for taking effective measures. The survey results will also help to monitor the children's education in Bangladesh

I would like to thank Mr. Md. Matiar Rahman, Director General, BBS for providing timely support and guidance to make the survey successful. Special thanks to Mr. Md. Mashud Alam, Director, Demography and Health Wing, BBS and his team for the execution of the survey from conceptualization to the production of this report.

Also Appreciation goes to the UNICEF Bangladesh for their long standing collaboration with BBS that enabled the survey to take place and the production of this report. All the distinguished members of technical committee, monitoring committee and working committee for their efforts at various stages and respondents for their inputs in the survey deserve special thanks.

I believe the information will assist in formulating evidence-based policy and planning as well as help monitoring the performance of Child development programs.

March, 2023

Dr. Shahnaz Arefin, *ndc*

Director General
Bangladesh Bureau of Statistics (BBS)
Statistics and Informatics Division (SID)
Ministry of Planning
Government of the People's Republic of
Bangladesh

PREFACE

Bangladesh Bureau of Statistics (BBS) has conducted the 'Survey on Children's Education in Bangladesh 2021' in collaboration with UNICEF Bangladesh to provide crucial data on the education of children and adolescents during the 18-month period of school closure in 2020-2021.

The household survey aimed to be completed within the shortest possible time so that new interventions and adjustments to existing education programs could be made quickly. BBS released the preliminary report in June 2022 and the final report now on February 2023.

The instruments and methodology used in Bangladesh MICS 2019 are the basis for this survey. Besides the new module "Learning online during school closure due to COVID-19," eight modules of the Bangladesh MICS 2019 have been used for this survey. The instrument was designed to allow comparison of a few indicators with the findings from similar surveys completed before the COVID-19 era.

I would like to express my gratitude to the Secretary of Statistics and Informatics Division, Ministry of Planning, for providing guidance and valuable support for the survey. Members of the Programme Implementation Committee (PIC) and Working Committee deserve special thanks for their contribution to the survey and to embedding quality assurance elements in this endeavor.

Furthermore, I express my sincere appreciation to Mr. Md. Mashud Alam, Director, Demography and Health Wing, and his team for their hard work and dedication in accomplishing the survey and finalizing the report. I would also like to extend my thanks to the concerned officials of BBS and SID.

I deeply acknowledge the collaboration of UNICEF Bangladesh for their technical and financial support to the survey. The long-standing partnership between BBS and UNICEF Bangladesh is expected to continue.

I believe that the report will be very useful to policymakers, researchers, development partners, NGOs, and other stakeholders to guide the formulation of programs and strategies.

March, 2023

Md. Matiar Rahman

Representative
UNICEF Bangladesh

MESSAGE

Data, information, and evidence are important elements that allow us to understand situations [on the ground] and take an informed decision to improve certain aspects of a situation. Survey on Children’s Education in Bangladesh 2021 – successfully conducted by the Bangladesh Bureau of Statistics (BBS) in partnership with UNICEF Bangladesh – generated primary data on key education and child protection-related indicators, which provides us with a greater understanding of where our children were in 2021, a year that was marred by COVID-19 pandemic across the globe, in terms of their educational access and learning as well as on issues relating to their protection and wellbeing.

The data captured through this survey has the potential for indicating the extent of the impact of the prolonged school closure due to the global pandemic COVID-19 prevalent during that period on children’s education and well-being, by comparing them to similar indicators from the MICS 2019 for Bangladesh. This understanding is expected to lead to a better realisation of whether any significant learning loss has happened, whether certain children populations had dropped out of school, whether the pre-existing digital divide had widened the educational disparity through unequal access to remote learning provisions, whether children were subject to the more acute form of negative social normative practices of child marriage and child discipline and what should be done to offset the negative impacts and supporting the children and their communities and education service providers with appropriate programmatic corrective responses.

Certainly, Bangladesh needs more rapid progress in these indicators to achieve the ambitious SDG goals by 2030 which is less than a decade away, and to continue to develop as a thriving middle-income country. There is enough global evidence that shows that these issues perpetuate the vicious cycle of poor human development leading to the continuation of poverty and disparity from one generation to another and eventually leading to less-than-optimal growth of the affected countries. I hope the new set of data available from this survey continues to promote a data-driven public discourse, policy-making, and programmatic response for the betterment of the children in Bangladesh.

It gives me great pleasure to see the publication of the survey report. On behalf of UNICEF and my colleagues who were associated with the survey, I would like to express my sincerest appreciation for the enormous work done by the BBS in planning, implementing, and preparation of the report on the National Survey on Children’s Education 2021, during a time that was difficult for field implementation, and the great role it plays in providing robust information on the situation of children. I also thank USAID Bangladesh for its generous financial contribution to generating key data.

March, 2023

Director
Demography and Health Wing
Bangladesh Bureau of Statistics (BBS)
Statistics and Informatics Division (SID)
Ministry of Planning
Government of the People's Republic of
Bangladesh

ACKNOWLEDGEMENT

The Demography and Health Wing of the Bangladesh Bureau of Statistics (BBS) conducted the 'Survey on Children's Education in Bangladesh, 2021' in collaboration with UNICEF Bangladesh in January 2022.

The survey was initiated mainly to generate data on a few selected key education indicators, including drop-out rate, foundational literacy and numeracy skills at primary and secondary education levels, as well as online learning and length of study during school closures due to COVID-19. The report presents estimates at the national and divisional levels, with disaggregation of the national level estimates by sex, location, relevant age groups, mothers' education level, children's functional difficulties, sex of the head of the household, ethnicity, and wealth index quintile.

I would like to express my gratitude to Dr. Shahnaz Arefin *ndc*, Secretary, Statistics and Informatics Division, and Mr. Md. Matiar Rahman, Director General, Bangladesh Bureau of Statistics, for their invaluable support and guidance in ensuring the smooth operation of the survey and finalization of the report. I am also grateful to Mr. Kazi Nurul Islam, Deputy Director General, BBS, for his support in preparing the report.

Also, I would like to acknowledge the contribution of UNICEF Bangladesh in terms of providing necessary funds and technical support for the implementation of the survey.

I would like to express my deepest appreciation to Professor Muhammad Shuaib, the Institute of Statistical Research and Training (ISRT), University of Dhaka, Mr. Mahboob-E-Alam, Statistics and Monitoring Specialist, Mr. Mashiur Rahman Khan, Statistics and Monitoring Officer (Rtd.), Ms. Laila Farhana Apnan Banu, Education Specialist, UNICEF Bangladesh for their technical inputs and support, and all the members of the Working Committee for their cooperation's in conducting the survey and finalizing the report.

My sincere appreciation to Ms. Asma Akhter, Deputy Director, Mr. Md. Lutfor Rahman, Statistical Officer (PRL), Mr. Md. Mahabub Alam, Statistical Officer, and all other team members of this survey for their extensive hard work to make the survey successful. All the enumerators of the survey also deserve special thanks for their cordial efforts.

I hope this report will be very useful for policy makers, planners, researchers, development partners, and other stakeholders, particularly for addressing issues on education that emerged due to COVID-19 pandemic.

Suggestions and comments for further improvement will be highly appreciated.

Md. Mashud Alam

March, 2023

EXECUTIVE SUMMARY

The Survey on Children's Education in Bangladesh, 2021, was conducted to generate estimates for a host of indicators on the status of children's education during the pandemic COVID-19. The survey aimed to generate primary data on a few selected key indicators including drop-out rate, foundational literacy and numeracy skills at primary and secondary education levels, as well as online learning with length of study during school closure due to COVID-19. The intent is to provide estimates at the national and divisional levels, with disaggregation of the national level estimates by sex, area, relevant age-groups, mothers' education level, child's functional difficulties, sex of the head of the household, ethnicity, and wealth index quintile.

The survey covered a sample of 9,000 households (8,995 successfully interviewed) across all 64 districts in 8 divisions. The Bangladesh Bureau of Statistics (BBS) conducted the survey between December 2021 and January 2022, in collaboration with UNICEF Bangladesh.

The specific objectives of the Survey on Children's Education were to capture the extent of impact of the prolonged school closure due to the onset of COVID-19 pandemic on drop-out and learning loss of children and adolescents, over the past 18 months, and to capture data on child marriage and child discipline, that are proven correlates of the education situation, which had impact due to prolonged closure of schools, necessitated to take appropriate measures to mitigate COVID-19 risks.

The Survey on Children's Education followed a two-stage stratified cluster sampling approach (design), utilised Computer-Assisted Personal Interviewing (CAPI) technique for face-to-face data collection at field level. One questionnaire with two modules, prepared on the lines of MICS6 standard questionnaire, was used in the survey.

Here is the summary of the findings of the report, which presents national level summary results of the survey. This is immediately followed by the analytical report containing division level estimate as also the disaggregated data by different household characteristics that are related to the indicator. A summary of the survey findings are presented below.

Household composition and housing characteristics

The majority of the surveyed households are headed by a male (87.6 percent); most of the members belong to age 35-64 years (69.8 percent) and are living mostly in the rural areas (76.5 percent). The households commonly had 3-5 members, about 68.5 percent (ranging from 19.7 to 29.1 percent). There are about two-thirds of the household heads have formal education, i.e., primary or above (65.9 percent).

Access to electricity of households are almost universal (98.4 percent). About a half of households (49 percent) have internet access at home, it is much higher in urban (65.3 percent) than in rural areas (44.0 percent).

A large proportion of households own their dwelling (87.5 percent), it is more in rural (95.5 percent) than in urban areas (61.6 percent), while about 4 in 10 households possess agricultural land (rural: 44.8 percent; urban: 22.1 percent) and 6 in 10 own farm animals/livestock. Ownership of livestock is mostly presents in rural areas (70.4 percent).

Almost every household has at least one member with a celular phone (96.0 percent) but only about 39 percent households have at least one member with a bank account, which is more prevalent among urban (53.3 percent) than in rural households (33.9 percent).

Sanitation

The survey shows that 88.7 percent of the population have access to improved sanitation, which is 4 percentage higher increase in past 3 years compared to MICS Bangladesh 2019 (84.6 percent) results. Again, 71.2 percent of the population is using improved sanitation facilities which is not public or shared, which again has increased by 7 percentage in the last 3 years (MICS 2019). Flush/pour to septic tank or to piped sewer system are the most commonly used facilities in the urban areas and pit latrine with a slab is the most common in rural areas.

Learning

A majority of children are attending school at their official age (primary: 77.7 percent, lower secondary: 66.2 percent) as compared to those attending at an age below the official age or are underage (primary: 5.2 percent, lower secondary: 7.4 percent). Children attending school at an age which is higher than the official age or are overage, are substantially high (primary: 17.1 percent, lower secondary: 26.4 percent), though they are much lower than those attending at their official age.

The Gross Intake Rate (GIR) to the last grade of primary school is 88.7 percent, about 8 percent higher among girls than boys (97.5 percent vs. 89.2 percent). GIR is similar in rural and urban areas but vary considerably across divisions (111.1 in Barishal and 67.6 in Mymensingh). The GIR to the last grade of lower secondary school is 83.6 percent and is much higher for girls (88.8 percent) than boys (74.9 percent).

Further, the primary school completion rate is 78.2, which is much higher for girls (85.6) than boys (70.7). The school completion rates however fall for lower secondary school (64.1 percent) and upper secondary school (20.2 percent). The rates are much lower than those reported in 2019 (MICS), especially at the primary and upper secondary levels ((primary: 82.6 percent; lower secondary: 64.7 percent and upper secondary: 29.4 percent)

The effective transition rate to the secondary level, i.e., children in the last grade of primary school moving on to secondary school has remained very high at 94.1 percent, which is very much comparable to 2019 rates (94.5 percent). These rates do not show much variations across sex of the child, area of residence, and even across the divisions.

The ratio of girls to boys, known as Gender Parity Index (GPI), attending primary, lower and upper secondary school, obtained from net attendance ratios, are 1.11, , 1.35 and 1.14, respectively, which suggests that more girls than boys attend school and particularly at the lower secondary school. Though GPIs by area are very similar to the overall GPI. It varies significantly across divisions (GPI in primary school is 1.49 in Mymensingh, while it is 0.99 in Rangpur).

Children's foundational reading skills seem to be lacking as among children aged 7-14 years, only 62.3 percent can correctly read 90% of words in a given story, while 52.8 and 52.9 percent of children correctly answered comprehension questions of three literals and two inferential, respectively, with an overall foundational reading skills are exhibited in 49.8 percent of children; urban children (56.8 percent) have better reading skills than rural children (47.7 percent). Foundational numeracy skills among children aged 7-14 years

are also at low levels with only 25.8 percent children who could complete all 4 tasks under the numeracy skills. Among them, 59.1 percent successfully completed number reading, 59.6 percent completed number discrimination, 53.5 percent completed addition and 37.5 percent recognized the pattern in numbers. Urban children are a little better than rural children in each of the numeracy tasks.

Primary school drop-out rates are much lower at 3.1 percent (boys: 4.0 percent, girls: 2.3 percent) and are about 4 percentage lower than that at upper secondary school (7.1 percent; boys: 6.4 percent, girls: 7.8 percent) while the drop-out rate at lower secondary level lies in between these two levels. The drop-out rates, regardless of education level, is 4.9 percent with insignificant differences across the background characteristics. On the other hand, the repetition rate is as high as 27.9 percent in upper secondary education, while it is much lower in primary education (3.7 percent) and lower secondary education (2.4 percent). The overall school repetition rate stands at 11.4 percent, irrespective of the level of education.

Online learning during the school closure due to COVID-19

The survey presents school age children's learning status before the closure of school due to COVID-19, during the peak hour of COVID-19, when a country wide lockdown was enforced and educational institutions remained closed as well as immediately after reopening of educational institutions in late 2021. It shows that that only about 1 in 5 (18.7 percent) school going children (regardless of education level) attended online learning during the school closure, with little sex differentials though the levels varied across area of residence (urban: 28.7 percent; rural: 15.9 percent). The primary level participation rate (13.1 percent) was lower compared to lower and upper secondary levels (20.3 and 23.7 percent, respectively). Overall, 36.9 percent of children had some supportive devices in the household to ensure online learning, which again was more in urban (50.6 percent) than in rural areas (32.9 percent), though sex differentials in availability of supportive devices was not very prominent. Nevertheless, among of the school age children who had the scope of using such devices for online learning, about 57.7 percent used them always, while 22.1 percent used them occasionally and 10.3 percent very little and about 1 in 10 (9.9 percent) never used devices for online learning. Usage of devices was more during the lockdown in urban (67.2 percent) than rural (53.4 percent) children. On an average the children. Studied online for about 3 hours (177.1 minutes) per day.

Regardless of education level, children's everyday study time for learning was 127 minutes per day at home, 190 minutes per day at school and 46 minutes per day at coaching centres, with a total of 363 minutes per day of study time before the school closure. This came down to about 124 minutes per day during the school closure, with 83 minutes at home, 13 minutes at school for online learning and about 278 minutes per day at coaching centres .

Among school going children, a large proportion of 95.5 percent children studied at home before the school closure for pandemic. This dropped sharply to 80.8 percent during the school closure and have not come to the pre-closure levels yet, as it has recovered to 90.8 percent after reopening of schools. Their average study time per day during the three periods are 117.5, 85.8 and 111.3 minutes, respectively. Also, during the three periods under discussion children studying at coaching centres was 48.7, 27.5 and 39.2 percent, respectively. The mean study time at coaching centres were 73.4 minutes, 68.2 minutes and 69.5 minutes per day, respectively, showing that the mean study time at home and at the coaching centres reduced during the school closure days together with the proportion of children that studied at home and at the coaching centres.

As mentioned before, about 4 in 5 school going children did not participate in online learning during the school closure. The main reason for non-participation in online learning (including through radio/television) during school closure were absence of scope of online learning from school (42.1 percent), absence of internet

facility at home (41.8 percent) and non-availability of supportive device for online learning at home (39.9 percent) and not having radio/television at home (30.9 percent).

The 'prolonged closure of school' was the most significant reason (43.6 percent) for children's non-attending any educational institution in the school year 2021, among those who attended school in 2020, i.e., those who dropped out in 2021. Besides, 'decrease in family income' (23.6 percent) and 'child's unwillingness to attend' (22.8 percent), were some other notable reasons for drop-out.

The measures taken by the household to prevent learning loss during school closure for COVID-19, 'self-learning' (44.2 percent), 'engaging a house tutor' (38.9 percent), and 'teaching by parents/family members' (24.0 percent) were the more important ones through which children got benefited. In contrast, 35.8 percent did not get any benefit as households did not take any measure in this respect. 'Giving assignment to students by teachers' (71.7 percent), 'monitoring by teachers through phone' (20.3 percent) and 'assigning homework by teachers' (20.0 percent) were the main measures taken by school that benefited the children to prevent learning loss during school closure. However, 17.5 percent of children did not get any benefit as the schools did not take any measure in this respect.

The school closure during the pandemic hampered children's classroom learning to a great extent was felt by large proportion of parents/caregivers of the school going children (72.2 percent) while some felt it has hampered children's classroom learning to some extent (26.2 percent).

About 64% of children's parents/caregivers felt that online learning during the pandemic was 'quite less' while about 33 percent felt it was 'less' or 'average' as compared to the effectiveness of classroom study before the pandemic.

Child marriage

The survey shows that 9.1 percent of women aged 15-24 years got married before the age of 15 while 11.2 percent and 40.7 percent of women aged 20-24 years got married before 15 and 18, respectively. Mother's education appears to be strongly negatively correlated with child marriage, where higher proportion of children are married off at an early age when mothers have low or no education (55.6 percent of women of age 15-19 are married), while this it is 28.4 percent among those whose mothers have higher education. Also, among women of age 20-24 years about 40.7 percent had been married before age 18, while 11.2 percent had been married before age 15 years. These proportions were 51.4 percent and 15.5 percent, respectively, in 2019 (MICS), showing consistent drop in the rates of child marriage over the years in Bangladesh.

To 'find a 'suitable groom' was reported as the main reason for marrying early (81.2 percent). While 'social practice' was cited by 23.6 percent of women, 'school closure due to COVID-19' as a reason for child marriage was reported in 5.1 percent cases.

Child functioning

About 4.2 percent of children aged 5-17 years were reported to have a functional difficulty in at least one domain of the listed domains⁶ based on the Washington Group on Disability Statistics. It was higher among boys (4.8 percent) than girls (3.6 percent) and in urban (5.3 percent) than in rural areas (3.9 percent). Among children who wear glasses, 2.7 percent have difficulty in seeing even after wearing glasses; of the children using hearing aid, 6.9 percent have difficulty in hearing even after using hearing aid and among children using

⁶ The domains include seeing, hearing, walking, selfcare, communication, learning, remembering, concentrating, accepting changes, controlling behaviour, making friends, anxiety and depression

equipment for walking, 28.8 percent have difficulty in walking even after using equipment. Though no area differences exist in these proportions, sex differences show that a higher proportion of boys difficulties than girls in all these three domains. Notably, about 37.7 percent of boys as against 20.9 percent of girls have difficulty in walking even after using equipment.

Conclusion

The Survey on Children's Education 2021 reflects the educational status of school age children immediately before and during the school closure for COVID-19 and after reopening of school. School readiness among primary school children is high (75 percent), indicating a high attendance in pre-primary education in the year before the survey year and is comparable with result in the year 2018 where it was 72.7 percent (MICS 2019). Although net attendance ratio (adjusted) in primary school is quite high (80.5 percent), it is considerably low in lower or upper secondary school (59.6 percent and 50.5 percent, respectively). The corresponding attendance ratios three years ago were very much higher at primary level (85.9 percent) but were comparable at lower secondary (57.8 percent) and upper secondary levels (48.1 percent). Similarly, the primary school completion rate is seen to be higher (84.3 percent) than lower and upper secondary school completion rates (69.4 percent and 32.2 percent, respectively), though they were also at similar levels in 2018 (MICS 2019). The gross intake rate to the last grade of primary school (88.7 percent) and lower secondary school (83.6 percent) as well as the effective transition rate to secondary school (94.1 percent) are very high. The GPI in school suggests girls had higher attendance than the boys particularly in lower secondary school (GPI 1.35) and were close to parity at other levels of education. Children of age 7-14 show moderate levels foundational skills in reading (49.8 percent children qualify all three reading skills), but their numeracy skills are disappointing (25.8 percent complete all 4 numeracy tasks). Drop-out and repetition rates in primary level are low (3.1 and 3.7 percent, respectively) although it is moderately high in upper secondary level (7.1 and 27.9 percent, respectively).

During the school closure due to COVID-19, children were less likely to participate in online learning (18.7 percent) mainly due to lack of scope of online learning from school (42.1 percent), absence internet support at home (41.8 percent), unavailability of supportive device (39.9 percent) and lack of radio/television at home (30.9 percent). Online learning apparently failed to satisfy parents, as they opined that online study was 'quite less' (64.0%) or 'less' (24.8%) effective in comparison to classroom study before the school closure. They also observed that the school closure hampered children's education a lot (72.2%) or to some extent (26.2%).

1. INTRODUCTION

1.1 Background

In March 2020, when the novel coronavirus (later termed as COVID-19 by WHO) started to spread in Bangladesh, the GoB immediately took various measures and strategies to tackle the situation including nation-wide shutting down the educational institutions, closing the market and other public spaces along with the transport system to restrict free movement and public gathering. School shutdown continued for 18 months and schools were reopened on September 12, 2021. During the closure, the GoB quickly established a remote learning system to ensure learning continuity, with lessons broadcasted on television and radio, e-content uploaded, and live classes conducted by teachers on online platforms. In addition, teachers and local education officials continued to communicate with students and parents, paid home visits, and distributed worksheets or assignments to aid remote learning activities.

Despite all these initiatives, there remained a high risk of substantial losses in learning and increasing drop-out rates, particularly in rural and remote areas, as not all children could be reached equitably by remote learning due to access to devices and connectivity. Analysis of past experiences of school closure confirms a significant reduction in foundational skills and basic competencies among children from 11 to 54 per cent.⁷

Against this backdrop, there was an urgent need to understand the extent (causes, consequences, and correlations) of COVID-19 on education (attendance, out-of-school, drop-out, and learning loss, among other education outcomes). Also, there was a need to learn status of its associated domains such as child marriage and violent discipline method against children, disaggregated by division, sex, area (urban/rural), relevant age groups, mothers' education levels, child's functional difficulties, ethnicity and wealth quintile. This was needed to make the authority able to take appropriate measures to mitigate the risks or learning losses that the COVID-19 crisis has induced, including attempts to reverse any negative trend, and restore past achievement in these areas.

Based on the felt need, Bangladesh Bureau of Statistics (BBS), Statistics and Informatics Division (SID), Ministry of Planning, Government of Bangladesh (GoB), in collaboration with UNICEF Bangladesh undertook an initiative to gather evidence-based data on the learning status of students during the school closure, side by side the status immediately before the outbreak of COVID-19 as well as after reopening of educational institutions, through a country-wide national survey of households.

This present report is based on this survey viz., Survey on Children's Education in Bangladesh, conducted in 2021 by the Bangladesh Bureau of Statistics (BBS). The survey provides statistically sound data on education situation after the outbreak of the COVID-19 pandemic, which are essential for developing evidence-based policies and formulating programmatic responses and to take appropriate recovery initiatives to address impact of COVID-19 on education,

Bangladesh has been responding to its commitment to children by implementing various development programmes through different social sector ministries such as the Ministry of Health and Family Welfare (MoHFW), Ministry of Primary and Mass Education (MoP&ME), Ministry of Education (MoE), Ministry of Social Welfare (MoSW), etc. A good number of laws/acts for protecting the rights of children have been enacted such as, the Children Act 2013, Birth and Death Registration Act 2013, Disabled People's Rights and Protection Act 2013 and National Human Rights Act 2009. These have been complemented by a number of national policies: Early Childhood Care and Development Policy 2013, National Children Policy 2011, National

⁷ UNICEF, 2020. COVID-19: Effects of School Closures on Foundational Skills and Promising Practices for Monitoring and Mitigating Learning Loss. Office of Research – Innocenti Working Paper WP 2020-13

Health Policy 2011, National Education Policy 2010, Child Labor Elimination Policy 2010, National Population Policy 2012, etc. The government has also formulated the national development strategy and the Five-Year Development Plans.

In addition to the efforts made by the GoB, international organisations such as UNICEF provided full support for television lessons, while UNESCO supported radio-based lessons.⁸ Notwithstanding these initiatives, there is a high risk of substantial losses in learning and increasing drop-out rates,⁹ particularly in the rural and remote areas, since all children could not be reached equitably by remote learning system due to lack of access to devices and internet connectivity.

1.2 Survey Objectives

Primary objectives of the Survey on Children's Education was to understand the extent (causes, consequences, and correlations) of COVID-19 on education (attendances, out-of-school, drop-out, and learning loss, among other education outcomes). As also the connected domains like child marriage and violence discipline method against children, to be able to take appropriate measures to mitigate the risks that the COVID-19 crisis has induced.

The specific objectives of the survey were:

1. To capture the extent of the impact of the prolonged school closure on the drop-out and learning loss of children and adolescents over the past 18 months.
2. To capture data on child marriage and child discipline connected to the education situation as a result of prolonged school closures

1.3 Scope of the Survey

Bangladesh Bureau of Statistics (BBS) and UNICEF Bangladesh agreed to jointly conduct this household (HH) survey to generate primary data on a few selected key indicators, including, drop-out rates, foundational literacy and numeracy skills at primary and secondary education levels. The plan aimed to provide estimates at the national and divisional levels, with disaggregation by division, child's sex, area of residence, relevant age groups, mothers/fathers' education levels, child's functional difficulties, ethnicity and household wealth quintile.

For this, the MICS¹⁰ (Multiple Indicator Cluster Surveys) instruments and approach has been used, considering the following advantages:

- The last round of MICS was conducted in Bangladesh in 2019. Therefore, conducting this survey in 2021 would enable a comparison between the pre-COVID 2019 data (as baseline) and current data (2021) on the selected indicators. With this, the impact of COVID-19 can be monitored.
- In the country, MICS is owned, managed, and technically supervised by the Bangladesh Bureau of Statistics (BBS), a government entity. The results generated in the survey are expected to give confidence to planners, decision-makers and programme implementing agencies for its efficient use.
- The MICS methodology incorporates Education, marriage and child discipline modules, within which tools and instruments were readily available for measuring school attendance, drop-out rate,

⁸ <https://www.unicef.org/bangladesh/en/stories/students-bangladesh-adjust-remote-learning-national-tv-during-covid-19-lockdown>

⁹ World Bank 2020. Simulating the Potential Impacts of COVID-19 School Closures on Schooling and Learning Outcomes: A Set of Global Estimates

¹⁰ MICS (Multiple Indicator Cluster Surveys): <https://mics.unicef.org>

foundational literacy and numeracy skills. The tools could be quickly customized, and a household survey could be immediately planned to reduce the planning and execution time.

- Trained enumerators who worked in the 2019 MICS round were tracked and engaged in data collection to reduce training time, as MICS involves extensive training processes.

The Survey on Children's Education results are expected to fill key data gaps by generating primary data on key education and protection indicators which will be vastly useful for planning and designing appropriate short, medium and long-term response and recovery measures to address the impact of the global pandemic, and thereby contributing to the achievement of the SDGs. The survey is also expected to contribute indirectly to the evidence base of other important initiatives of the Government of Bangladesh and international organisations towards children's betterment and welfare.

This report presents the results from the survey together with analysis of results.

2. SURVEY METHODOLOGY

2.1 Sample Design

The sample for the Survey on Children's Education in Bangladesh 2021 has been designed to provide estimates for a host of indicators on children's educational status in Bangladesh at the national level, for urban and rural areas, and for eight divisions of the country. A two-stage, stratified cluster sampling approach was used to select the survey sample. The sampling frame was based on the 2011 Bangladesh Census of Population and Housing. The primary sampling units (PSUs), selected at the first stage, are the enumeration areas (EAs) defined for the census enumeration, and are selected from the PSU's selected for MICS 2019. The MICS 2019 household listing has been used for each sample EA, and a sample of households has been selected at the second stage.

The number of PSUs and households in the sample of the survey are 450 and 9,000, respectively.

2.2 Sample Size

The overall sample size for the Survey on Children's Education is 9,000 households. For the calculation of the sample size, the key indicator used is the proportion of drop-out among school age children. Since the survey results were planned to tabulate at the divisional level, it was necessary to determine the minimum sample size for each division. For the purpose, the following formula has been used:

$$n = \frac{[4(r)(1-r)(deff)]}{[(0.12r)^2(pb)(AveSize)(RR)]}$$

Where

n = the required sample size, expressed as number of households

4 = a factor to achieve the 95 percent level of confidence

r = the predicted or anticipated value of the indicator, expressed in the form of a proportion

$deff$ = the design effect for the indicator, estimated from a previous survey or using a default value of 1.5

$0.12r$ = the margin of error (ME) to be tolerated at the 95 percent level of confidence, defined as 12 percent of r (relative margin of error of r)

pb = the proportion of the total population upon which the indicator, r , is based

$AveSize$ = the average household size (number of persons per household)

RR = the predicted response rate

For the calculation, r (proportion of drop-out) has been taken as 4.5 percent. The value of $deff$ (design effect) has been taken as 1.3 based on estimates from MICS 2019. Further, pb has been taken as 42 percent, $AveSize$ (average household size) has been taken as 4.3 persons per household, and the response rate is assumed to be 90 percent.

The formula above has been used to calculate expected margins of error for different sample sizes at the divisional level. The relative margin of error (RME) is found higher at the divisional level and finally considered at 25 percent level to calculate the sample size. The conclusion from studying the expected confidence

intervals and RME is that 1000-1,200 households per domain would be adequate to yield estimates with sufficient precision for most of the indicators. It had been decided to have an average sample size of about 1,125 households per stratum. The strata will be the eight divisions. This would give a total sample size of 9,000 households at the national level.

2.3 Sample Allocation

The number of households selected per cluster for the survey has been determined as 20 households, therefore, 450 clusters were required. As sampling fractions (SF) are varying between divisions (SF, i.e., the number of sample households to total household, is much higher for Barishal division compared to Dhaka division due to the different population size), it resulted in variation in sampling weights. Thus, a few departures from the equal allocation of the sample were made while considering the minimum number of required sampled households (1,000) for the precise estimates at the divisional level. The equal allocation has been therefore been adjusted in a way that it increased the sample for larger divisions and decreased for the smaller divisions compared to an equal allocation.

Table SM 2.1: The allocation of sample households and clusters within each of the eight divisions, Survey of Children’s Education in Bangladesh, 2021

Division	Number of PSUs			Number of households		
	Rural	Urban	Total	Rural	Urban	Total
Barishal	42	8	50	840	160	1,000
Chattogram	48	17	65	960	340	1,300
Dhaka	53	22	75	1,060	440	1,500
Khulna	45	10	55	900	200	1,100
Mymensingh	42	8	50	840	160	1,000
Rajshahi	45	10	55	900	200	1,100
Rangpur	44	6	50	880	120	1,000
Sylhet	42	8	50	840	160	1,000
Total	361	89	450	7,228	1,772	9,000

2.4 Listing Activities and Selection of Households

As mentioned earlier, the households listed for MICS-2019 have been used for this survey in order to minimize the time required for fresh listing of households, with the assumption that not much change would have happened in the number of households in the selected PSU during this short period. The listed households were sequentially numbered from 1 to n (the total number of households in each enumeration area). Then, 20 households in each enumeration area were selected using random systematic selection procedures. The MICS6 spreadsheet template for systematic random selection of households has been adapted and used for this purpose.

2.5 Data Collection Method

The Survey was conducted using Computer-Assisted Personal Interviews (CAPI) technique for face-to-face data collection at field level. The data collection application has been developed based on the CPro (Census and Survey Processing System) software, version 7.2. Procedures and standard programmes developed

under the global MICS programme have been customized for the Survey on Children's Education 2021 questionnaire and used throughout.

2.6 Training

Training for the final data collection took place for 7 days during December 12-19, 2021, except on December 16, 2021, the national victory day. Since, trained enumerators who worked in the 2019 MICS round were tracked and engaged in data collection, it justified the reduction in training time, as MICS involves extensive training processes. Training included lectures on interviewing techniques and the contents of the questionnaire, and mock interviews between trainees to gain practice in asking questions. Participants first completed full training on the paper questionnaire, followed by training on the CAPI application. The trainees spent three days with paper questionnaires, three days with CAPI, and one full day on the field practice.

Six officials of the BBS headquarter worked as trainers and 26 supervisors and 83 enumerators for the survey participated in a face-to-face training programme at BBS headquarter in Dhaka. In addition, 8 Joint Directors of 8 divisions and 64 Deputy Directors/Statistical Officers of BBS from 64 districts, participated in the training from a remote location online as coordinators of the survey.

Field supervisors attended additional training on the duties of team supervision and related responsibilities.

2.7 Fieldwork

Twenty-four (24) teams, each comprised of 3 interviewers and 1 supervisor, have collected data from the selected PSUs in 21 working days from December 21, 2021 to January 10, 2022. Android-based tablets were used for the data collection. The tablets utilized a Bluetooth application for field operations, enabling transfer of assignments and completed questionnaires between supervisor and interviewers.

2.8 Fieldwork Quality Control Measures

Team supervisors remained responsible for the daily monitoring of fieldwork. Besides supervision of household interviews, the supervisor observed the work of team members and guided them when needed. He/she observed interviewers' skills and performance every day.

During the fieldwork, in addition to the division and district survey coordinators, the BBS survey management team members and senior officials visited the field teams. Throughout the fieldwork, field check tables (FCTs) were produced weekly for analysis and to allow field teams to take immediate corrective measures.

2.9 Data Management, Editing and Analysis

Data were received in the server of BBS headquarter via Internet File Streaming System (IFSS) integrated into the management application on the supervisors' tablets. Data were synchronized at the headquarter on a regular basis as soon as they were ready. The monitoring teams established at the BBS headquarter communicated application updates or any other technical issue to field teams through this system.

During the data collection and following the completion of fieldwork, data were edited according to editing processes outlined in detail in the MICS Guidelines for Secondary Editing¹¹, a customised version of the standard MICS6 documentation.

The datasets were analysed using the Statistical Package for Social Sciences (SPSS) software, version 23. Model syntax and tabulation plan developed by UNICEF were customised and used for this purpose.

2.10 Data Tables

The tables based on the data from the survey have been included as part of the sections under which a theme of the survey has been covered and have not been put under a separate section. It may be noted that some of the indicators are based on relative smaller unweighted sample cases. Following the MICS guidelines, all estimates based on smaller samples, unweighted sample numbers between 25 and 49, should be used with caution, and estimates based on less than 25 unweighted sample numbers are not statistically robust and should not be used.

2.11 Survey Findings

Following the basic statistical disclosure control (SDC) procedure, unique identifiers such as location and names collected during interviews were removed from datasets to ensure privacy and anonymity. These anonymised data files are made available on the BBS website and can be freely downloaded for legitimate research purposes.

2.12 Questionnaire

One questionnaire with two modules was used in the survey: 1) A household module to collect basic demographic information on all *de jure* household members (usual residents), household characteristics and the dwelling; 2) A module for children and adults aged 5-24 years, administered to all mothers (or caregivers) or child him/herself living in the household.¹²

In addition to administering the questionnaire, fieldwork teams observed the latrines. Also, the module for children and adults age 5-24 years included a reading and mathematics assessment administered to children age 7-14 years.

The questionnaire included the following modules:

HOUSEHOLD MODULE	CHILDREN AGE 5-24 YEARS MODULE
<ul style="list-style-type: none"> • Household Information Panel • List of Household Members • Education [3+ Years] including Effect of COVID-19 on Education and Psycho-Social Aspects • Early Childhood Development • Household Characteristics • Sanitation 	<ul style="list-style-type: none"> • Learning and Attendance to School • Child Discipline [5-14] • Child Functioning [5-17] • Parental Involvement [7-14] • Foundational Learning Skills [7-14] • Marriage [10-24]

¹¹ <https://mics.unicef.org/tools#data-processing>

¹² Children aged 15-17 years living without their mother and with no identified caregiver in the household were considered emancipated and the questionnaire for children aged 5-17 years has been administered directly to them.

In line with the survey's objectives to capture information on children's educational status during COVID-19, some new questions were incorporated into the existing education modules to explore the influence of the pandemic on education and learning of the children.

Using the MICS6 standard questionnaire, a draft structured questionnaire was developed based on the study's objectives. The questionnaire was modified and translated into Bangla and tested in combination with the CAPI application on November 27, 2021 (the paper questionnaire) and December 4, 2021 (the CAPI application). Based on the results, modifications were made to the wording and translation of the questionnaire and its CAPI application. A copy of the questionnaire is provided in Appendix 2.

2.13 Ethical Protocol

As a National Statistical Office, BBS considered all the ethical issues of conducting this survey as though there was no biological experiment involved. Specific strategies necessary to prevent or avoid COVID-19 infection and spread were addressed. Additionally, the study was human rights-based (including child rights) and gender-sensitive, where all applicable data are disaggregated by sex and age. BBS formed different committees to review or approve all the procedures and survey tools and provide necessary guidelines for smooth operation of the survey.

Verbal consent was obtained for each of the respondents participating and, for children age 15-17 years individually interviewed, an adult consent was obtained before obtaining child's assent. All respondents were informed of the voluntary nature of participation and the confidentiality and anonymity of information. Additionally, respondents were informed of their right to refuse to answer all or particular questions, as well as to stop the interview at any time.

3. SAMPLE COVERAGE AND CHARACTERISTICS OF RESPONDENTS

3.1 Results of interview

Results of the sample implementation including response rates are presented in Table SR¹³.1.1. Of the sample of 9,000 households, 8,996 were found to be occupied. Of these, 8,995 were successfully interviewed with a household completion rate of 99.9 percent and response rate of 100 percent.

In the interviewed households, 5,333 girls and women (age 10-24 years) were identified. Of them, 5,318 were successfully interviewed, resulting in a response rate of 99.7 percent within the interviewed households. Similarly, a total of 9,415 children age 5-17 years were identified. Of them, 9,384 children were interviewed, which corresponds to a response rate of 99.7 percent within the interviewed households.

By area of residence and division, a similar pattern exists with respect to the number of households sampled, occupied and interviewed and girls and women age 10-24 years and children age 5-17 years eligible and interviewed.

Table SR.1.1: Results of households, girls and women age 10-24's and children age 5-17's interviews											
Number of households, girls and women age 10-24 and children age 5-17 by interview results, Bangladesh, 2021											
	Total	Area		Division							
		Urban	Rural	Barishal	Chattogram	Dhaka	Khulna	Mymensingh	Rajshahi	Rangpur	Sylhet
Households											
Sampled	9,000	1,780	7,220	1,000	1,300	1,500	1,100	1,000	1,100	1,000	1,000
Occupied	8,996	1,778	7,218	999	1,297	1,500	1,100	1,000	1,100	1,000	1,000
Interviewed	8,995	1,778	7,217	999	1,296	1,500	1,100	1,000	1,100	1,000	1,000

Interviewed	9,384	1,760	7,624	1,055	1,628	1,379	1,055	1,019	896	948	1,404
Children age 5-17's response rate	99.7	99.7	99.7	99.2	99.5	99.9	99.6	99.5	99.9	99.8	99.9

3.2 Housing and household characteristics

Tables SR.2.1 and SR.2.2 provide details on the household level characteristics. Most of the information collected on the housing characteristics have been used in the construction of the wealth index.

Table SR.2.1 presents area and division-wise housing characteristics, i.e., access to electricity and internet, number of rooms used for sleeping and mean number of persons per room used for sleeping.

¹³ Table numbers have been suffixed with the acronym of the chapter names for easy referencing throughout the report. E.g., SR has been added to show that tables relate to the chapter on Sample Respondents.

In Table SR.2.2, households are distributed according to ownership of land, dwelling and selected durable assets as well as livestock by households (which includes ownership by individual household members).

Access to electricity is almost universal without variations at area of residence and divisional levels (98.4 percent of the households have electricity; interconnected grid is the most common source with 95.2 percent, off-grid is rare with 3.2 percent; while 1.6 percent do not have electricity). Of 37,935 members of the households successfully interviewed, 98.7 percent have access to electricity in the household with a similar pattern across divisions and areas of residence (Table SR.2.1).

Almost every 1 in 2 households has internet access at home (49.0 percent); however, access to education programmes by the students also depended on access to internet in the neighbour's or friends' household which the students of the sampled households could have accessed and used. Internet access is much higher in urban area (65.3 percent) compared to rural households (44.0 percent). As expected, households in Dhaka division have the largest proportion of internet access than households in all other divisions where households in are twice as likely to have internet access (61.3 percent) as households in Mymensingh and Rangpur (30.1-30.7 percent) which has lowest access among the divisions (Table SR.2.1).

The majority of the households use 1-2 rooms for sleeping (30.6 percent use 1 room and 44.1 percent use 2 rooms). Although no area differences exist, division level variations show a higher percentage of households in Barishal using 2-3 or more rooms (86.7 percent) than households in other divisions. On an average 2.3 persons live per room used for sleeping with very little variation between urban and rural areas and across divisions (Table SR.2.1).

About a half (48.9 percent) of the households have a television - much higher in urban area (68.5 percent) than in rural area (42.8 percent). Dhaka and Rajshahi have more households with television compared with the remaining divisions. Possession of radio in households is quite nominal (0.6 percent). Again, while 93.8 percent of households have electric fans and 44.4 percent have refrigerators, only 7.0 percent have a member having a computer or tablet.

Survey also shows that about 9 in 10 (87.5 percent) households own a house which is much higher in rural (95.5 percent) than in urban area (61.6 percent). About 2 in 5 households (39.5 percent) possess agricultural land which is lower in Chattogram, Dhaka and Sylhet divisions as compared to other divisions. About 61 percent of households own livestock. (Table SR.2.2).

Among the personal belongings owned by at least one member of household, mobile phone was owned by the largest proportion of households (96 percent), while land phone was used only by 0.4 percent, with negligible area and divisional level differences.. About 2 in 5 (38.5 percent) members of household reported having their bank accounts. (Table SR.2.2).

Table SR.2.1: Housing characteristics

Percent distribution of households by selected housing characteristics, according to area of residence and division, Bangladesh, 2021

	Total	Area		Division							
		Urban	Rural	Barishal	Chattogram	Dhaka	Khulna	Mymensingh	Rajshahi	Rangpur	Sylhet
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

3.3 Household composition

Table SR.3.1 provides the distribution of households by selected background characteristics, including the sex of the household head, age, area of residence, division, education of household head, number of household members, and ethnicity. Both unweighted and weighted numbers are presented. Such information is essential for the interpretation of findings presented later in the report and provide background information on the representativeness of the survey sample. The remaining tables in this report are presented only with weighted numbers. The figures in the table are also intended to show the numbers of observations by major categories of analysis in the report. The weighted and unweighted total numbers of households are equal as sample weights are normalized.

According to Table SR.3.1, the majority of households are headed by a male (87.6 percent). Majority of the household heads belong to age group of 35-64 years (69.8 percent). Again, most of them are situated in rural areas (76.5 percent). Comparatively a higher proportion of the households has 3-5 members (19.7 to 29.1 percent). Households have 4.9 members on an average. About two-third of the household heads have formal education (66 percent; 27.2 percent have primary and 38.8 percent secondary or above). 96.1 percent of the households are Bengali and the rest are of 'other' ethnicity. One third of households (33.9 percent) have at least a child under the age of 5, while 75.6 percent have at least one child age less than 18.

Mean household members	4.2	37935	38573

[A] Each proportion is a separate characteristic based on the total number of households.

3.4 Age structure of household population

The weighted age and sex distribution of the survey population is provided in Table SR.4.1. In the households, successfully interviewed, a weighted total of 37,935 members have been listed. Of them, 18,841 are males, 19,094 females.

Table SR.4.1 shows the age-sex structure of the household population. The proportions of child (0-14), working (15-64) and old-age (65 years and over) groups in the sampled households are 27.6, 66.4 and 5.9 percent respectively without any area differences. The household population aged less than 18 is 33.7 percent and adult members aged 18+ is 66.3 percent; the proportions are similar for males and females, each having one-third aged less than 18 and two thirds aged 18+.

Table SR.4.1: Age distribution of household population by sex

3.5. Household wealth index quintiles

Table HC.5.1 shows how the household populations in areas and divisions are distributed according to household wealth quintiles. The distribution of household population in the wealth index quintiles is even with 20 percent each by design, but rural households have a larger share in the poorest and second quintiles (22.4 and 23.1 percent, respectively) than those in the wealthier two quintiles (20.2 and 12.6 percent). Dhaka (28.4 percent) and Sylhet (21.3 percent) have higher proportion of households in the richest quintile, than other divisions. (Table HC.5.1).

Table HC.5.1: Wealth quintiles

Sylhet	21.5	21.5	16.5	19.2	21.3	100.0	2719

3.6 Sanitation

An improved sanitation facility is defined as one that hygienically separates human excreta from human contact. Improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines and pit latrines with slabs. Table WS.6.1 (and Figure WS.1) shows the population using improved and unimproved sanitation facilities. It also shows the proportion of household population who dispose of faeces in fields, bushes, open water bodies, beaches, or other open spaces, or with solid waste, a practice known as 'open defecation'. Further, the table presents the distribution of household population using improved and unimproved sanitation facilities which are private (i.e., not shared), shared with other households or public facilities.

In Bangladesh, 88.7 percent of the population is living in households using improved sanitation facilities with very small urban-rural variations (Table WS.6.1). Residents of Sylhet (83.5 percent) and Chattogram (82.5 percent) divisions are less likely to use improved sanitation facilities than those of Khulna division (95.4 percent). The table indicates that the use of improved sanitation facilities is apparently positively correlated with education of household head, household wealth status, and is profoundly different between Bengalis and other ethnic population. Relatively a more common facility in use is the pit latrine with a slab (36.9 percent), followed by flush/pour to septic tank (24.4 percent) and flush/pour to pit latrine (22 percent). Flush/pour to septic tank and flush/pour to piped sewer system are the most common facilities in urban area and use of pit latrine with a slab is the most common in rural area.

Table WS.6.2 reveals that 71.2 percent of the household population is using an improved sanitation facility that is not shared and 17.5 percent use an improved sanitation facility that is public or shared with other households. Urban households with access to an improved toilet facility are slightly more likely than rural households to share the facility (19.8 percent and 16.8 percent, respectively). Use of shared toilet facility is more common among households with improved sanitation facilities. Across divisions, sharing of improved sanitation facilities is most prevalent in Mymensingh (24.8 percent) and the least in Barishal (8.5 percent). Variations in use of sanitation by area and divisions is also shown in Figure WS.1 below.

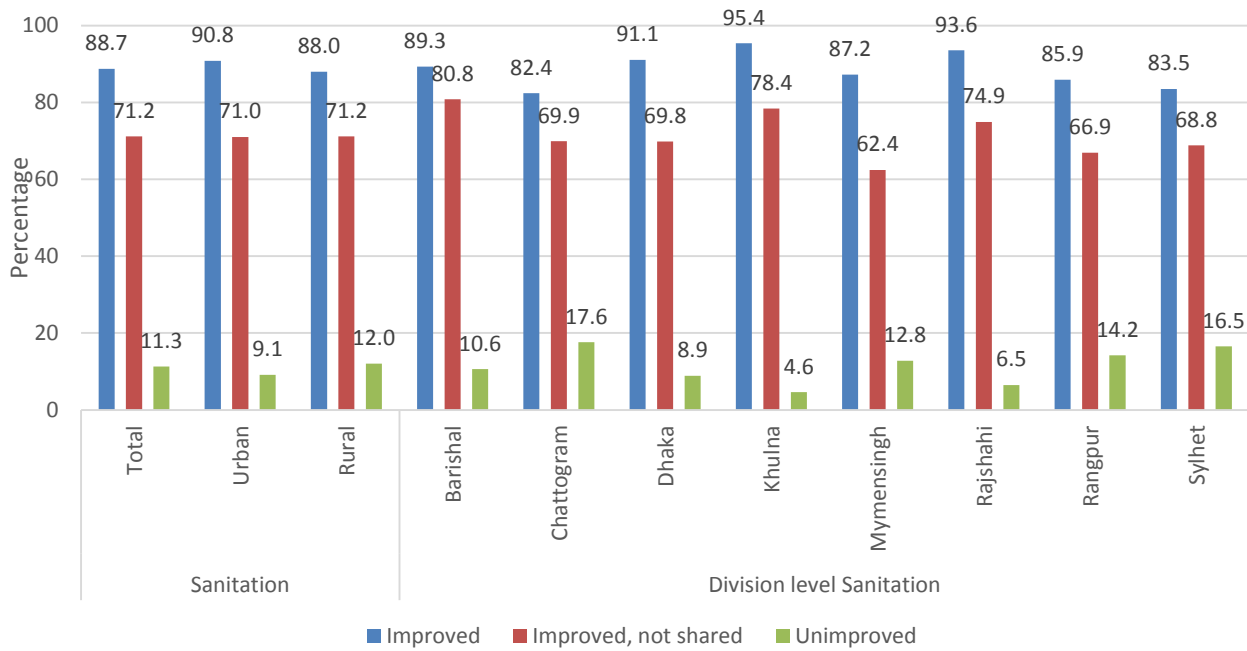

Table WS.6.1: Use of improved and unimproved sanitation facilities
Percent distribution of household population according to type of sanitation facility used,
Bangladesh, 2021

	Type of sanitation facility used by household										Total	Percentage using improved sanitation	Number of household members
	Improved sanitation facility						Unimproved sanitation facility			Open defecation (no facility, bush, field)

Figure WS.1: Access to sanitation facility in the household by area and division, Bangladesh, 2021

4. LEARN

Ensuring all girls and boys complete primary and secondary education is a target of the 2030 Agenda for Sustainable Development. Education is a vital prerequisite for combating poverty, empowering women, propelling economic growth, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

In Bangladesh, children enter primary school at age 6, lower secondary school at age 11 and upper secondary school at age 14. Before primary education, there is pre-primary education offered at the state-run Government Primary Schools for 5-year-olds children for one year. There are 5 grades in primary school. In primary school, grades are referred to as year 1 to year 5. For lower secondary school, grades are referred to as year 6 to year 8 and in upper secondary to year 9 to year 12. The school year in Bangladesh typically runs from January to December.

4.1 School readiness and attendance

Attendance to pre-primary education is important for the readiness of children to school. School readiness is defined as children attending the first grade of primary school after attending early childhood education programme in the previous school year. Table LN.1.1 shows the proportion of children in the first grade of primary school (regardless of age) who attended any early childhood education in the previous year.¹⁴

Table LN.1.2 presents the percentage of children of entry age at primary school to grade 1 (net intake ratio) while Table LN.1.3 provides the percentage of children of primary school age 6 to 11 years who are attending primary or lower secondary school¹⁵, and those who are out of school. Similarly, the lower secondary school adjusted net attendance ratio is presented in Table LN.1.4¹⁶ for children aged 12 to 14 years.

In Table LN.1.5, children are distributed according to their age against current grade of attendance (age for-grade). For example, an 8-year-old child (at the beginning of the school year) is expected to be in grade 3, as per the official age-for-grade. If this child is currently in grade 1, he/she will be classified over-age by 2 years. The table includes both primary and lower secondary levels and presents information on children's age (whether underage or at age or over age) by grade they are currently attending.

The upper secondary school adjusted net attendance ratio, and out of school children ratio are presented in Table LN.1.6.¹⁷

Overall, 75 percent of children who are currently attending the first grade of primary school had attended pre-school the in previous year (Table LN.1.1). Though the proportion of first graders who attended pre-school

¹⁴ The computation of the indicator does not exclude repeaters, and therefore is inclusive of both children who are attending primary school for the first time, as well as those who were in the first grade of primary school the previous school year and are repeating. Children repeating may have attended pre-primary education prior to the school year during which they attended the first grade of primary school for the first time; these children are not captured in the numerator of the indicator.

¹⁵ Ratios presented in this table are "adjusted" since they include not only primary school attendance, but also secondary school attendance in the numerator.

¹⁶ Ratios presented in this table are "adjusted" since they include not only lower secondary school attendance, but also attendance to higher levels in the numerator.

¹⁷ Ratios presented in this table are "adjusted" since they include not only upper secondary school attendance, but also attendance to higher levels in the numerator

from different 'background characteristics' is similar to that of the overall proportion, yet it is little lower among children in Rangpur (59.9 percent) when compared with other divisions (66.3 to 81 percent).

In Bangladesh, 56.7 percent of children who are of primary school entry age (age 6) (net intake rate), are attending the first grade of primary school (Table LN.1.2) where there are negligible sex and area differentials. However, differentials are evident by division. Children are entering in more timely manner in Chattogram, Barishal, Sylhet and Rajshahi (66.4 to 60 percent) than in remaining divisions with Mymensingh having the lowest proportion (42.3 percent). The net intake rate in school can be seen to increase somewhat with mother's education and socioeconomic status (wealth index) suggesting a positive correlation between them.

Table LN.1.3 reveals that about 4 in every 5 children of primary school age (80.5 percent) are attending school (either primary or lower secondary); with attendance levels little higher for girls (84.8 percent) than boys (76.3 percent). Yet, 19.5 percent of the children remain out of school, which comprise 15.4 percent not attending school and 4.1 percent are attending pre-school in that age. It may be noted that the children attending pre-school in that age are in fact starting school late and are counted as out of school. There are not much of differentials between children in urban and rural areas when it comes to both attendance and remaining out of school. However, percentages vary by divisions with Rangpur showing the highest attendance (89 percent) and Mymensingh, the lowest (67.6 percent). Age is an important factor in school attendance rate, the attendance rates increase with child's age starting from age 6 to 10 years. Similarly, attendance rates increase with mother's education level and household wealth status, ranging from 71.5 to 86.8 for the lowest to highest level of mother's education and from 74.9 to 84.4 for the lowest to the highest wealth equity status.

Table LN.1.4 shows that 59.6 percent of adolescents of secondary school age are attending lower secondary school or higher. The remaining, 24.7 percent are still attending primary school and 15.7 percent are out of school. These proportions are higher among girls (69.0 percent) than in boys (50.9 percent), as was seen in the case of primary school attendance, the rates are similar in urban (61.7 percent) and rural areas (59.1 percent), though they vary considerably across divisions, ranging from 46.8 percent (Mymensingh) to 67.5 percent (Rangpur). Again, the attendance rates increase with the with the age of child, ranging from 43.9 percent to 73.6 percent, among children of age 11 and 13 at beginning of school year, respectively. Similar positive correlation are evident between attendance levels of lower secondary school or higher and mother's education as wealth status of the household.

From Table LN.1.5, it can be seen that while about 4 in every 5 children (77.7 percent) of primary school age attended primary school (or at the official age), only 2 in every 3 children (66.2) of lower secondary school age attended the level at the official age. Over-age attendance was about 17.1 percent at the primary level, while it was 26.4 percent at the lower secondary level. Similar proportions can be seen with negligible variations by sex of children and household heads, area of residence and division in both primary and lower secondary school attendances. Attending at the right official age increases with higher mother's education and the household wealth index status.

Table LN.1.6 reveals that 50.5 percent of adolescents of upper secondary school age are attending upper secondary school or higher (higher among girls with 53.9 percent compared to boys with 47.1 percent). Among the remaining, 15.3 percent are still attending lower secondary school or below, while 34.2 percent are out of school. Upper secondary school net attendance is higher in urban (56.6 percent) than rural areas (48.7 percent). Variations by division exist, ranging from 41.2 percent in Sylhet to 59.6 percent in Barishal. As in the case of primary or lower secondary, the attendance rates for upper secondary school also show positive relationship with household wealth status and mother's educational level.

[2] MICS indicator LN.6c - Out-of-school rate for youth of upper secondary school age

[A] The percentage of children of upper secondary school age out of school are those who are not attending primary, secondary or higher education

[B] Children age 18 or higher at the time of the interview

Figure LN.1: Net attendance ratios, attendance in primary, lower and upper secondary schools and out of school children by level of education, Bangladesh, 2021

Reference: Tables LN.1.3, LN.1.4 and LN.1.6

Table LN.1.7 presents the gross intake rate and completion rate in primary school and transition rate to secondary education, gross intake rate and completion rate in lower secondary school and completion rate in upper secondary school by different background characteristics. The gross intake rate is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year. Completion rate of primary education represents the percentage of a cohort of children age 3 to 5 years above the official age of the last grade of primary education, that is, the percentage of children age 13 to 15 years, who completed primary education.¹⁸ The table also provides the “effective” transition rate, which takes account of the presence of repeaters in the final grade of primary school. This indicator reflects the fact that pupils repeat the last grade of primary education but eventually make the transition to the secondary level.¹⁹

Table LN.1.8 focusses on the ratio of girls to boys attending primary, lower and secondary school by background characteristics. These ratios are better known as the Gender Parity Index (GPI). The further from 1 a parity index lies, the greater the disparity between groups. When an index value falls between 0.97 and

¹⁸ In other words, the primary completion rate is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year.

¹⁹ The simple transition rate, which is no longer calculated in MICS, tends to underestimate pupils’ progression to secondary school as it assumes that the repeaters never reach secondary school.

1.03, it is regarded as parity between two groups. It is to be noted that the ratios included here are obtained from adjusted net attendance ratios rather than gross attendance ratios. The latter provides an erroneous description of the GPI mainly because, in most cases, the majority of over-age children attending primary education tend to be boys.

Table LN.1.7 shows that the gross intake rate to the last grade of primary school is 88.7 percent; higher in urban (101.5 percent) than rural areas (85.1 percent), though there is not much disparity by sex. The rate varies considerably across divisions (111.1 in Barishal and 67.6 in Mymensingh). Further, the gross intake rate varies between 77.6 and 105.8 percent between the households belonging to different wealth quintiles, with no specific pattern – it being the lowest for children in the second (poor) wealth quintile and highest for those in the fourth (rich) quintile.

Table LN.1.7 further shows that the primary school completion rate accounts for 78.2; this is 70.7 for boys and 85.6 percent for girls. This rate is very similar between areas but varies considerably across divisions (85.7 percent in Barisal and 70.7 percent in Mymensingh). Also, the primary school completion rate varies by household wealth status and it increases with the level of wealth status, showing a positive correlation between them.

The table also shows that 94.1 percent of the children in the last grade of primary school are expected to move on to secondary school. The effective transition rates do not show any remarkable variations by area of residence and sex of the child. Some variations can be seen across divisions with respect to the effective transition rate to secondary school (Khulna and Rangpur have 100.0 percent, while Mymensingh has 87.3 percent). Variations household wealth quintile are not marked and do not show any consistent pattern.

Gross intake rate to the last grade of lower secondary school is 83.6, with substantive although no area difference exists, sex differentials, being higher for girls (95.7 percent) than boys (72.00 percent). Upper secondary completion rate is 20.2 percent, which is much lower than lower secondary (64.1) and primary school completion rates (78.2 percent) (Table LN.1.7).

Table LN.1.8 shows that gender parity for primary, lower secondary and upper secondary schools are 1.11, 1.35 and 1.14, respectively, which indicate that girls are more likely than boys to attend school particularly in lower secondary level. The pattern by area is not different from the overall pattern. However, there are considerable variations among divisions with regard to gender parity in all three levels of education: at primary level, Mymensingh (GPI 1.49) shows much higher attendance of girls than boys, while parity is much closer in other divisions, indicating almost equal attendance ratios of girls and boys. In lower secondary education, Khulna has the highest level of gender parity index (GPI 1.51) with Barishal has the lowest (1.25). In the case of upper secondary education, Rajshahi and Khulna have the best parity in attendance (GPI's 0.96 and 1.05, respectively) while Sylhet has worst (GPI 1.75). The table shows an improvement in gender parity (GPI getting closer to 1.00) with increasing education level of mothers and with improving economic condition (wealth quintile index).

4.2 Support for child learning at school and learning environment at home

Parental involvement is essential for supporting children for learning at home. Parental involvement in their children's education is widely accepted to have a positive effect on their child's learning performance. For instance, reading activities at home have significant positive influences on reading achievement, language comprehension and expressive language skills.²⁰

Studies also show that parental involvement in their child's literacy practices is a positive long-term predictor of later educational attainment.²¹

Beyond learning activities at home, parental involvement that occurs in school (like participating in school meetings, talking with teachers, and volunteering in schools) can also benefit a student's performance.²² Studies have shown that, in the primary school age range, the impact of parental involvement in school activities can even be much bigger than differences associated with variations in the quality of schools, regardless of social class and ethnic group.²³

Table LN.2.1 provides information on children 7 -14 years attending school and the support for child learning at school and learning environment at home.

Most of the children of 7 – 14 years are currently attending school (84.7 percent); this percentage is a little higher among girls (89.3 percent) than the boys (80.2 percent) though it is almost the same between urban and rural areas. Attendance of children with functional difficulties (68.5 percent) is substantially lower than their counterpart (85.4 percent). Children's attendance vary considerably across divisions ranging from 71.8 percent (Mymensingh) to 93.3 percent (Rangpur). Attendance rates are positively associated with mother's education and household wealth status, with rates increasing with levels of mothers education and household wealth status.

In terms of supporting children for learning at home, 95.2 percent of children read books or are read to at home; where differentials by sex of the household head, area of residence and division are not seen. However, mothers education and household wealth status seem to have a considerable influence on whether a child reads or is read to at how with rates increasing as the respective levels go up.

Survey further shows that percentage of children using the same language at home as that used by teachers at school is very high (95.8 percent). The pattern is very similar across various household characteristics, though Chattogram records a relatively lower level at 83.3 percent. For mothers with only preschool or no education, this practice is reported for 85.2 percent of children, much lower than those with mothers with higher education (7.9 percent), the difference being similar to the proportions for children from the poorest and richest households (84.9 and 97.9 percent, respectively).

[A] Attendance to school here is not directly comparable to net attendance ratios reported in preceding tables, which utilise information on all children in the sample. This and subsequent tables present results of Foundational Learning Skills.

na: not applicable

4.3 Foundational learning skill

Foundational learning is exactly what it sounds like – the foundations of a child's education. It refers to basic literacy, numeracy, and transferable skills which are the building blocks for a life of learning. The ability to read and understand a simple text is one of the most fundamental skills a child can learn. Yet today, across most of the developing countries, these foundations of learning are not strong enough.²⁴ In many countries, students enrolled in school for as many as 6 years are unable to read and understand simple texts, as shown for instance by regional assessments such as the Latin American Laboratory for Assessment of the Quality of Education (LLECE), the Programme for the Analysis of Education Systems (PASEC) and the Southern and Eastern Africa Consortium for Monitoring Educational Quality (SACMEQ).²⁵ Acquiring literacy in the early grades of primary is crucial because doing so becomes more difficult in later grades, for those who are lagging behind.²⁶

²⁴ The urgent need to focus on foundational skills, Alicia Herbert, Jaime Saavedra, Leanna Marr and Robert Jenkins, published on Education for Global Development, November 04, 2021, <https://blogs.worldbank.org/education/urgent-need-focus-foundational-skills>

Foundational learning ensures better life outcomes by empowering individuals to take advantage of the extensive benefits of education in later years. It is directly correlated to increased workforce participation and opens up opportunities for social and economic advancement. Research has also linked foundational learning to increased employability and higher Gross Domestic Product (GDP).²⁷

A strong foundation in basic numeracy skills during the early grades is crucial for successes in mathematics in the later years. Mathematics is a skill which is very much in demand and most competitive jobs require some level of skills in mathematics.²⁸

There are a number of existing tools for measuring learning outcomes²⁹ with each approach having their own strengths and limitations as well as with varying levels of applicability to household surveys such as MICS. For some international assessments, it may just be too late: “Even though international testing programs like PISA and TIMSS are steadily increasing their coverage to also cover developing countries, much of the divergence in test scores happens before the points in the educational trajectories of children where they are tested by international assessments”, according to longitudinal surveys like the Young Lives Study.³⁰ National assessments such as the Early Grade Reading Assessment, which happens earlier (Assessment, which was conducted before the Young Lives Study) are more context specific, will however be less appropriate for cross-country analysis; although it may be possible to compare children who do not complete an exercise, (zero scores) set at a level which reflects each national target for children by a certain age or grade. Additionally, it is recognized that some assessments only capture children in school. However, many children do not attend school, further data on these out-of-school children is needed and these can be adequately captured in household surveys. The survey on children’s education applied the test of children’s basic reading and numeracy skill to measure their learning outcome.

Tables LN.3.1 (and Figure LN.3) and LN.3.2 (and Figure LN.4) present percentages of children aged 7-14 years who demonstrated foundational reading skills by correctly answering three foundational reading tasks and foundational numeracy skills by successfully completing four foundational numeracy tasks, respectively, by age, sex, area of residence, division, wealth index quintile and other disaggregation. These indicators are designed and developed for both national policy development and SDG reporting for SDG4.1.1 (a): Proportion of children in grade 2/3 achieving a minimum proficiency in (i) reading and (ii) mathematics by sex. Table LN.3.1A and Table LN.3.2A present percentages of children aged 7-14 years who correctly answered foundational reading and numeracy tasks respectively by gender parity.

The assessment score of reading tasks is further disaggregated by results of the literal questions and inferential questions. The disaggregation of numeracy skills such as number reading, number discrimination, addition and pattern recognition and completion are also available.

As Table LN.3.1 and the corresponding Figure LN.3 show, of the children of age 7-14 years, 62.3 percent correctly read 90% of words in a given story; girls (65.7 percent) showed a better performance in reading correctly than their boy counterparts (58.8 percent). Again, urban children have higher capacity than rural

children to read correctly (71 and 59.8 percent, respectively). By division this percentage varies from 56 percent in Sylhet to 70.2 percent in Dhaka. As expected, older children are more likely than younger children to be able to read correctly 90% of words of the given story. Ability to correctly read 90 percent of words appears to have a positive correlation with mother's educational level and household wealth level.

Percentage of children who correctly answered comprehension questions in terms of two or three literals is about 53 percent whereas urban children (60-61 percent) show better performance than rural children (about 51 percent) (Table LN.3.1). Percentage of children who demonstrated foundational reading skills (correctly completing all the three reading tasks) is 49.8 percent; again, higher in urban area (56.8 percent) than in rural area (47.7 percent). Children's foundational reading skill level varies between 42.7 percent (Sylhet) and 58.4 (Dhaka) divisions, increases with the age of child, as also with the level of mother's education as well as the wealth status.

Table LN.3.1A shows that, overall, gender parity in foundational reading skills of the children age 7-14 years exhibits that girls are better placed than boys (GPI 1.13). No remarkable differences exist between rural and urban areas, though a slight difference are evident at division level – with near parity in Rangpur (GPI 0.91) to more disparity (with girls better placed) in Khulna (GPI 1.27). Gender parity is better at lower secondary (GPI 0.96) and upper secondary (GPI 1.01) levels than that at primary level (GPI 1.10).

Regarding children's foundational numeracy skills (Table LN.3.2), 59.1 percent of children age 7-14 years successfully completed number reading, 59.6 percent number discrimination, 53.5 percent addition, 37.5 percent recognized the pattern in numbers and 25.8 percent completed all four combined, termed as 'foundational numeracy skill'. Boys and girls show similar levels of completion across all four individual tasks as well as the level of foundational numeracy skills, when combined. Regardless of sex, urban children are better placed than rural children in numeracy skills. Largely a moderate difference in numeracy skills exists across the divisions with overall skill level varying between 19.8 percent (Khulna) to 30.7 percent (Dhaka). As in the case of foundational reading skill, the foundational numeracy skill also increases with age, the level of education of the child and their mother, as well as the wealth status.

Overall, gender parity in foundational numeracy skills of children age 7-14 (Table LN.3.2A) exhibits very near parity (GPI 1.03) between boys and girls without much of area differences. Yet, a moderate divisional level difference is found with Rajshahi showing perfect parity to Mymensingh at GPI 1.51 indicating much lower skill levels of boys as compared to girls. Gender parity by education level shows parity at primary and upper secondary levels (GPI 0.97 and 0.99, respectively) but a little lower foundational numerical skill among girls than that of boys at lower secondary level (GPI 0.91),

4.4 Drop-out and repetition

For various reasons drop-out from school happens in Bangladesh and it goes up from primary to upper levels of education. Despite various initiatives such as providing stipend, free textbooks, school feeding programmes etc., to retain students are in place, drop-out continue to happen. Out of 100 children enrolled in the first grade, only 32 retain till upper secondary level (Bangladesh Bureau of Educational Information and Statistics, or BANBEIS). Poverty, child marriage, high-priced note-guide books, compulsory coaching and weak teaching system are the key factors responsible for drop-outs. The education ministry recently listed causes of drop-outs that include early marriage of students of ultra-poor families, students' untimed entry into job market due to poverty and not succeeding in the test and final examinations. Girl students' drop-out happens mainly because of early marriage and distance of educational institutions from residence.³¹

Table LN.4.1 provides information on primary, lower secondary and upper secondary aged children's drop-out³² from school. It gives the percentages of primary, lower secondary and upper secondary aged children who attended a given grade in the last school year before the survey year, but are no longer attending school in the current year (i.e., survey year). Together with this, the table presents gender parity status in drop-out among boys and girls in primary, lower secondary and upper secondary school, and also when considering all children.

The primary school drop-out rate comes out as 3.1 percent (with a minor variation between boys and girls - 4 and 2.3 percent, respectively); the rate increases to 5 percent in lower secondary education (with no sex differentials) and 7.1 percent in upper secondary education. A moderate difference exists in drop-out from primary and lower secondary education across different background characteristics. As for upper secondary level, 7.1 percent of children drop out, which is 4 and 2 percentage points higher than drop-out rates in primary and lower secondary education, respectively. Moderate variations in drop-out rates exist between divisions, ranging from 3.6 percent in Khulna to 11.9 percent in Mymensingh and Sylhet, at the upper secondary level. Drop-outs vary across wealth quintiles in all three levels of education, with no consistent pattern, but mother's education appears to have an inverse relationship with drop-out in all three levels of education, implying that drop-out rates decrease with increase of mother's education.

Table LN.4.1 further shows that the overall drop-out rate irrespective of the level of education is 4.9 percent with moderate differences by almost all background characteristics.

The gender parity in drop-out presented in the table suggest a lower drop-out rate among girls than boys in primary (GPI 0.58) and lower secondary (GPI 0.77) education, but it is reversed in upper secondary education (GPI 1.22), suggesting a big gap in drop-out rates with girls more likely to drop-out than boys. Regardless of education level, GPI of 0.90 indicates that drop-out from school is more or less similar among boys and girls.

Table LN.4.2 provides grade specific drop-out rates from grade 1 to grade 12. The rates exhibit a moderate variation across grade 1 to grade 4 (2.0 to 3.0 percent), then it slightly goes up to 6.0 percent from grade 5 to grade 11; while it is 14.3 percent, the highest, in grade 12. Although drop-out rates vary moderately between boys and girls and urban and rural students across grade 1 to grade 12, it varies considerably at divisional and wealth quintile levels at grade 5, 10 and grade 12. For example, the rate ranges from zero percent at grade 5, and between 6.9 percent to 20 percent at grade 12. Mymensingh shows very high drop-out rates

³¹ <https://m.theindependentbd.com/arcprint/details/76539/2017-01-15>

³² Drop-out rates refer to the proportion of students from a cohort attending a given grade in a given school in a given year who are no longer attending school in the following year. Children who repeat are considered to be in the school and hence not included in the calculation of drop-out rate (MICS EAGLE)

among all the divisions, especially at grade 5 (12.6 percent), grade 10 (14.1 percent) and grade 12 (32.7 percent).

Grade repetition is the continuation in a school programme at the same grade level for part or all of the next school year due to failing to acquire the minimum expectations or outcomes to proceed to the next grade level. A repeater is defined as a pupil who is not promoted to the next grade or does not complete an educational programme and who remains in the same grade the following school year (UIS, 2012: 17³³). Repetition can result from academic failure, unsatisfactory progress, insufficient examination marks to get promotion to the next level of education, age criterion, poor attendance or from lack of local educational opportunities. It may be obligatory or, in the case of some more developed countries, it may require the agreement of the student and/or parents.

Repetition in primary, lower secondary and upper secondary education and in any level of education is presented in Table LN.4.3. In primary education, repetition rates stand at 3.7 percent. Except at divisional levels, repetition rates are not varying significantly across various background parameters: Rajshahi at 10.3 percent and Mymensingh at 2 percent) have the highest and the lowest repetition rates, respectively. The repetition rate at lower secondary education is 2.4 percent, lower than primary as well as the upper secondary levels, and do not show significant variations across different background characteristics. At upper secondary education, repetition is quite high with 27.9 percent; even higher among boys (29 percent) compared to girls (26.5 percent). Overall, repetition in any level of education is 11.4 percent; it does not vary much across different background characteristics except at division level where the rates vary between 8.3 percent (Mymensingh) and 15.8 percent (Rajshahi), as well as across mother's education levels where it ranges from 10.4 percent (or 10.5 percent) among children of mothers with primary (or below primary) education to 17.6 percent for mothers with secondary education.

Girls are less likely to repeat than boys at lower and upper secondary levels (GPI 0.83 and 0.91, respectively) while their likelihood to repeat is much more than boys at primary education (GPI 1.19) (Table LN.4.3). The GPI in repetition considering all levels of education is 0.94, indicating a better parity among girls and boys than at different levels of education.

Table LN.4.4 shows that grade specific repetition rates are very high at grade 10 (61.2 percent) and at grade 12 (41.6 percent) as compared to those at lower grades ranging between 2.1 percent and 5.4 percent (at grades 5 and 11, respectively). Having externally managed exams at grades 10 and 12 could be one of the reasons for spikes in repetition rates in these levels compared to other levels where exams are managed and administered by schools themselves. Repetition rates at grade 10 show moderate variations across various background characteristics. For example, the repetition rate among boys is about 7 percentage points higher than that of girls. Similarly, rural children have higher repetition rates (62.8 percent) than their urban counterparts (55.5 percent) at grade 10. Mymensingh division has the lowest repetition rate (50.1 percent) and Chattogram has the highest rate (72.4 percent) at grade 10, while the differences between divisions are higher in magnitude when we observe the repetition rates as grade 12. At grade 12, it varies between 26 percent (Rangpur) to 51.4 percent (Sylhet) across divisions, and between 33.4 percent and 45.5 percent between urban and rural areas. A difference of about 20 percentage points can be seen between children belonging to poorest quintile (51.5 percent) and those in the second wealth quintile (31.4 percent).

³³ Global education digest, 2012: opportunities lost: the impact of grade repetition and early school leaving. <https://learningportal.iiep.unesco.org/en/glossary/grade-repetition>

[1] and [2] : Drop-out rate is the proportion of students from a cohort attending a given grade in a given school in a given year who are no longer attending school in the following year.

* Includes grades 11 and 12.

Table LN.4.3: Repetition of primary, lower secondary and upper secondary aged children

Percentage of primary, lower and upper secondary school going children in a given grade who repeated the following-year; Repetition rates of girls to boys (GPI), in primary, lower and upper secondary school, and additional parity indices taking all children, Bangladesh, 2021

	Primary				Lower secondary				Upper secondary				Total (Primary, Lower and Upper secondary)

4.5 Learning online during school closure

In March 2020, COVID-19 has resulted in academic closure in Bangladesh. This severely affected the majority of the students and other involved people of the education sector. Many countries all over the world have started the online education system and are continuing with this process to minimize the learning gap. Online education through social media is now the best possible alternative to face-to-face learning. Platforms like Facebook, Zoom, Google classroom, Google meet etc. are some of the mediums through which academic institutions are trying to communicate with the students.³⁴ Bangladesh also adopted a variety of measures to minimize learning gaps, which included broadcasting lessons on Television and Radio, uploading e-contents and conducting live classes by teachers on online platforms. In addition, teachers' and local education officials' continuous communication with students and parents, home visits and distribution of worksheets or assignments to ensure remote learning activities. The Survey on Children's Education has assessed children's learning status during the COVID-19 pandemic.

Table LN.5.1 presents percentages of primary, lower secondary and upper secondary school age children according to their participation in online learning during school closure by level of education. The table also presents percentages of children by level of education according to the presence of devices in the household to assist children with distant learning and the pattern or frequency of use of those devices for online learning and online study time (in minute) per day.

Table LN.5.2 presents percentages of primary, lower secondary and upper secondary school age children by scope of using devices for online learning at home during the school closure for COVID-19.

Table LN.5.3 presents school age children's mean learning time (in minute) in a day before and during the school closure for pandemic, by primary, lower secondary and upper secondary levels and overall.

Table LN.5.4 provides school age children's mean study time (in minute) in a day at home before and during the school closure and after reopening of school. It also presents percentages of school age children who studied at home before and during the school closure and after reopening of school. Similarly, Tables LN.5.5 and LN.5.6 provide information on school age children's mean study time (in minute) in a day at school and coaching centres respectively before and during the school closure and after reopening of school. It is to be noted that online study time is considered as school education.

Table LN.5.1 shows that, regardless of education level, 18.7 percent of children attended online learning during the school closure; this level though not significantly different among boys and girls, it varied significantly between areas of residence (28.7 percent for urban and 15.9 percent for rural children) and division between 5.7 percent (Mymensingh) and 23.4 percent (Khulna). The participation in online learning increased with the age of the child at the beginning of school year, level of mother's education and household wealth index, thereby showing a positive association between these set of variables. Participation rate was lower at primary level (13.1 percent) compared to secondary level (20.3 percent at lower secondary and 23.7 percent at upper secondary levels).

Irrespective of education level, 36.9 percent of children reported the presence of any device in the household to assist them with online learning. Girls (39.0 percent) were a little more likely than boys (34.8 percent) to have presence of these devices. The presence of devices is seen to be much more for urban children (50.6

³⁴ Online Education during COVID-19 in Bangladesh: University Teachers' Perspective. Mimma Tabassum, Seefat E Mannan, Md Iftakhar Parvej and Firoz Ahmed. Source: https://www.researchgate.net/publication/348418346_Online_Education_during_COVID-19_in_Bangladesh_University_Teachers'_Perspective

percent) as compared to rural children (32.9 percent). It varied widely across divisions ranging from 12 percent (Mymensingh) to 49.7 percent (Dhaka). The presence of devices seem to have a positive correlation with mother's educational level and household wealth level, showing an increase in proportions with an increase in levels of these two parameters. By level of education, the presence rate was almost similar (between 36.1 to 38.2 percent (Table LN.5.1).

Overall, 30.3 percent of children had scope of using devices at home regularly for online learning and 10.5 percent had scope of using 'occasionally' and a few 'rarely' (4.6 percent) or did not have such a scope (4.3 percent), while 50.3 percent had no devices (Table LN.5.2). A very similar picture is evident for boys and girls, but a far different picture existed in urban and rural areas (45.9 percent of urban children and 25.4 percent of rural children had scope of regular use) and across divisions (8.9 percent of children in Barishal and 47.6 percent of children in Dhaka had the scope of regular use). Also, a positive association exists between the scope of regular use of devices and child age, mother's education level and household wealth index quintile, where the scope increased when child age, mother's education and wealth quintiles moved from lower to higher levels.

Of the school age children, regardless of education level, 57.7 percent always, 22.1 percent, occasionally and 10.3 percent used devices very little for online learning during the school closure (Table LN.5.1). The remaining 9.9 percent of children did not use such devices at all. The urban children were more likely than rural to have always used devices (67.2 percent vs. 53.4 percent), though there no gender differentials. Divisions show a wide variation in 'always' using devices, ranging from 28.1 percent in Sylhet to 70.3 percent of children in Dhaka. Also, a moderate to wide variation exist across mother's education and household wealth quintiles with respect to using devices always. All-time use of devices appears to be very similar across primary, lower and upper secondary levels.

Regardless of education level, the school age children studied online for 177.1 minutes per day during the school closure; slightly higher in urban (187.2 minutes/day) than in rural area (171.9 minutes/day). The online study time varies considerably between divisions, ranging from 143.5 (Rajshahi) to 201.5 minutes per day (Chattogram). The online study time per day appears to have a positive association with child's age at the beginning of school year, mother's education and household wealth index quintile, where it increased with an increase in level for each of these background characteristics. The online study time at primary level was 158.9 minutes per day as compared to 176.6 at lower secondary and 188.1 minutes per day at upper secondary level (Table LN.5.1).

Table LN.5.3 shows that, regardless of education level, children's overall study time at home before and after school closure were 127.1 minutes per day and much lower at 83.4 minutes per day, respectively. Similarly, they studied 190.0 minutes per day at school, before and 13.3 minutes per day at school after the school closure (for online learning). Study time at coaching centre were 46.1 minutes per day before and 26.8 minutes per day after the school closure, while overall study time were 363.3 minutes per day and only 123.6 minutes per day, before and after school closure, respectively. The mean study time, irrespective of education level and place of study before or after school closure vary very marginally across sex of child and area of residence, and varies considerably across divisions with children in Khulna reporting the highest mean study time (379.0 minutes/day) as against those in Rajshahi with the lowest mean study time (336.4 minutes/day) before the school closure, while children in Chattogram had the highest (147.1 minutes/day) and Mymensingh had the lowest mean study time (101.1 minutes/day) after the school closure. Mean study time seem to be positively associated with mother's education and household wealth status. Children's mean study time significantly dropped after the school closure when compared with that before the school closure at primary, lower secondary and upper secondary levels. For each of the levels of education, children in urban area had a longer study time after the school closure, compared to children in rural area. Children in Chattogram had the longest mean study time per day after the school closure at primary, lower-secondary and upper-secondary levels compared to children in other divisions

Table LN.5.4 reveals that 95.5 percent of children studied at home before the school closure, 80.8 percent during the school closure and 90.8 percent after reopening of school. No significant sex and area differentials regarding studying at home for different school opening status exist. However, differentials are evident by division especially during the school closure ranging from 70.8 percent (Rajshahi) to 89 percent (Barishal). Percentages of children who studied at home during the school closure and after reopening of school were the lowest among children age 20-24 years (68.4 and 73.7 percent, respectively) and the highest among children age 10-14 (83.6 percent) during the school closure and for children age 5-9 years (94.9 percent) after reopening of school. In contrast to the situation before the school closure, children, whose mothers have higher education, were a little more likely than other children to study at home during the school closure (87.2 percent) and after reopening of school (94.3 percent).

Table LN.5.4 further reveals that children's mean study time per day at home before and during the school closure and after reopening of school was 117.5 minutes (1 hour, 57.5 minutes), 85.8 minutes (1 hour, 15.8 minutes) and 111.3 minutes (1 hour, 51.3 minutes), respectively, clearly showing a drop-in study time by about 30 minutes per day during school closure days when compared with days when schools were open. Division level estimates suggest that a moderate gap exists between them with regard to the study time at home during the three status of school opening. While the lowest study time of 101.9 minutes per day was reported in Rajshahi and the highest study time at home of 139.4 minutes (2 hours, 19.4 minutes) per day was reported in Khulna before the school closure, during the school closure Rajshahi again shows the lowest study time per day at home (71.1 minutes) as against Chittogram reporting the highest ((90.4 minutes per day). After schools reopening, Barishal reported the highest (128.8 minutes) and Rajshahi reported the lowest (92.8 minutes) per day study time at home. In all three periods, the study time per day increased consistently with the age of the child as well with the increase in mother's education and household wealth status, irrespective of the status of the school opening.

As Table LN.5.5 indicates the study time at school among the school going children. It shows that a great majority of children studied at school, both before the school closure (94.1 percent) and after reopening of school (85.7 percent). A small proportion studied at school during the school closure (7.9 percent), when they went to school to do online classes. While almost no sex and area differentials exist in this regard, notable differentials were found across divisions after reopening of school. Khulna had the highest percentage of children (17.9 percent) and Sylhet has the lowest percentage of children (2.8 percent) who studied at school during the school closure. Barishal (93.3 percent) had the highest proportion of children and Khulna (79.4 percent), the lowest proportion of children who studied at school after their reopening. Children of mothers with higher education were more likely than other children to study at school after reopening of school (93.6 percent). No clear association is seen between proportion of children studying at school and household wealth status both before closure and after reopening of school.

Table LN.5.5 also shows that children's study time per day at school before and during the school closure and after reopening of school were 186.2 minutes, 80.3 minutes and 86.1 minutes, respectively, thereby showing a considerable drop in study time per day at school before closure and after their reopening. Though study time at school by sex of child and area of residence are very similar to the overall study time, except that the urban children had a higher study time than rural children during the school closure where children devoted time on online learning.. Division level variations suggest that a moderate difference exists among divisions with regard to the study time. For example, before the school closure, in Barishal children spent the lowest time per day (161.5 minutes) and at Rangpur, the highest study time (197.3 minutes). ; In all three periods of school before closure and after reopening, the study time per day varied with age of the child, by mother's education or with the wealth status but did not show any definitive pattern of variations with these household characteristics.

Table LN.5.6 provides the percentage of primary, lower secondary and upper secondary school age children by their study at coaching centre and mean study time (in minute) there before and during the school closure and after reopening of school. About a half (48.7 percent) of the children before the school closure, 27.5

percent during the school closure and 39.2 percent after reopening of school, studied at coaching centres. The percentage of children who studied at coaching centres was very close between boys and girls and children in urban and rural areas. However, percentage of children who studied at coaching centers varied considerably across divisions, ranging from 39.3 percent (Sylhet) to 53.5 percent (Dhaka) before the school closure, 22 percent to 36.9 percent in Rangpur and Khulna, respectively, during the school closure and 28.4 percent (Mymensingh) and 48.8 percent (Khulna), after reopening of schools. Children whose mothers had secondary education were more likely than others to have studied at coaching centres before and during the school closure and after reopening of school (54.7, 37.3 and 49.7 percent, respectively). The corresponding percentages for children whose mothers had no education or only preschool were considerably low (39.9, 19.9 and 31.6 percent, respectively). Again, studying at coaching centres was found to be positively associated with household wealth status.

Mean study time of the children at coaching centres before and during the school closure and after reopening of school were 73.4, 68.2 and 69.5 minutes per day, respectively. Children's mean study time at coaching centres was very close between boys and girls and children in urban and rural areas, though it varied considerably across division, child age, and to some extent across mother's education and household wealth status. For example, Dhaka division had the highest (78.4 minutes/day) and Barishal division, the lowest (66.9 minutes/day), study time before the school closure; corresponding highest and lowest for the study time in coaching centre during school closure was in Chottogram (74.3 minutes per day) and Khulna and Sylhet (64.3 minutes per day). Mymensingh ((78.2 minutes per day) recorded the highest and Sylhet (62.9 minutes per day) recorded the lowest study time at coaching centre after reopening of school. (Table LN.5.6).

Table LN.5.1: Online education during school closure due to COVID-19
Percentage of primary, lower secondary and upper secondary school age children who participated in online learning during school closure and average study time by education level, Bangladesh, 2021

After discussing results on attendance in online studies before and during school closures and after reopening of schools and mean time spent in online studies at home, in school and coaching centres in the periods before school closure, during school closure and after reopening of schools, the sections below discuss reasons for not going to educational institutions, measures taken to make up for learning loss of children due to COVID-19 pandemic etc.

While Table LN.5.7 provides reasons for not being able to take education through online/radio/television during school closure by primary, lower and upper secondary school age children, Table LN.5.8 shows percentages of primary, lower secondary and upper secondary school age children according to reasons for not going to any educational institution in the current academic year (2021). Thereafter, in Table LN.5.9A, the overall percentages of school age children according to measures taken by their families and schools to fill their learning loss during school closure due to COVID-19 and in Table LN.7.9B education-level disaggregated percentages of school age children according to measures taken by their families and schools to fill their learning loss during school closure have been presented.

Finally, percentages of primary, lower secondary and upper secondary school going children according to their parents' perception of online study during the school closure have been provided in Table LN.5.10.

Table LN.5.7 shows that, regardless of education level, about 2 in 5 children mentioned 'no scope of online education/learning from school', 'no scope of using internet at home' and 'no supportive device at home for online learning' (42.1, 41.8 and 39.9 percent, respectively) as three main reasons for not being able to take education through online method during the school closure. In addition, 30.9 percent of children mentioned that 'no television or radio in the household' for learning using these devices and hence they had no scope of attending online learning. Learning through 'Institutes gave assignment to students' and thus not requiring online classes (24.2 percent), 'permanent closure of school' (17.6 percent), and "students' unwillingness" (14.3) were some less frequently cited reasons for not attending online study. Though sex differentials were not prominent, some area differentials existed when it came to lack of 'scope of using internet', 'availability of TV and radio' and 'scope of availability of devices at home' for online learning, with urban areas showing more scope or availability than rural areas (37.7 against 42.8 percent for internet, 24.6 against 32.4 percent for TV/radio and 32.8 against 41.6 percent for devices, respectively). Differentials are evident at division level with higher differentials seen for the reason 'institutes gave assignments' to students to complete at a high level in Sylhet (56.3 percent) compared to Mymensingh, where it was the least (16.2 percent). Similarly, the reason 'no scope of using internet at home' was most frequently reported in Barisal (54.4 percent) and the least in Mymensingh (33.4 percent). Differentials are also marked with respect to the reason 'no supportive device at home for distant learning' with Barishal reporting this reason most frequently (59.4 percent) than other divisions, while Sylhet reported the least (32 percent) For the three education levels, primary, lower and upper primary, reasons of 'no scope of distant education from school', 'no scope of using internet at home', 'no supportive device at home for distant learning' and 'no television or radio in the household can be seen as the main reasons for not participating in online study..

Table LN.5.8 (and Figure LN.5) shows that comparing with any other reasons for children's non-attendance in any educational institution for the school year 2021, the reason 'prolonged closure of school' (43.6 percent) is the most predominant one. This is followed by 'decrease in family income' (23.6 percent), 'child's reluctance to attend' (22.8 percent) are the other two important reasons reported by more than 1 in 5 children. Rural children are more likely than urban to remain absent for 'prolonged closure of school' (46.2 vs. 35.1 percent) and for 'child marriage/pressure for marriage' (20.1 vs. 10.2 percent), while the scenario is just the opposite for other reasons.

Table LN.5.9 reveals that regardless of education level, 44.2 percent of children mentioned 'self-learning' as the main measure taken by the household to fill learning loss during school closure for COVID-19. This was followed by 38.9 percent of children reporting 'to engage house tutor' and 24 percent mentioned 'teaching by

parents/family members' as the main measures taken by the household. A little over 1 in 3 (35.8 percent) children reported that their 'household did nothing' (no measure) to fill learning loss. More or less a similar pattern regarding household measures exists by sex of child, area of residence as well as household wealth index. Variation at divisional level shows that children reporting 'self-learning' was the highest in Sylhet (66.2 percent), 'engage a house tutor' was reported highest by children in Khulna, while 'households did nothing' was reported the highest in Mymensingh as part of measure taken by households to fill loss of study.. Children, whose mothers have higher education report 'teaching by parents/family members' (64.2 percent), 'self-learning' (53.6 percent) and 'engage a house tutor' (47.8 percent) which are higher than other education levels. By level of education, children at both lower secondary (48.7 percent) and upper secondary (53.9 percent) levels mentioned 'self-learning', while children at primary level (36.6 percent) mentioned 'engage a house tutor' as main measures taken by the households to fill their learning loss.

Further, majority (71.7 percent) of children mentioned 'giving assignment to students by teachers' as the main measure that was taken by school to fill learning loss during school closure for COVID-19. About 20.3 percent of children considered 'monitoring by teachers through phone' and 20 percent thought that 'giving homework by teachers' was one of the main measures taken by the school. A little over 1 in 6 children (17.5 percent) felt that their 'school did nothing' (took no measure) to fill for the learning loss. No significant variation exists by sex of child, though there are some variations across area of residence and division for some of the reasons. Children reporting reasons of 'teachers monitoring through phone' and 'provide education through online' were widely different and much higher in urban than in rural areas (28.9 vs 17.6 and 24 vs 9.7 percent, respectively). While as high as 86.7 percent of children in Sylhet considered 'teacher gave assignment', only 58 percent of children in Mymensingh thought so. 'Providing education through online' means as a measure taken by school also varied lot between divisions (24.5 percent in Dhaka and 5.2 percent in Rangpur). By level of education, higher proportion of children at primary (55.5 percent), lower secondary (86.2 percent) and upper secondary (87.6 percent) levels mentioned 'giving assignments by teachers' as the main measure taken by school to fill learning loss. (Table LN.5.9).

Table LN.5.10 shows that, regardless of educational level, majority (72.2 percent) of the children's parents viewed that classroom learning was hampered 'a lot' and a quarter (26.2 percent) opined that it was 'somewhat' hampered due to the school closure. Though no sex and area differentials can be seen, yet, differentials are evident across divisions. Sylhet, with the highest percentage of parents (84.5 percent) reported the highest and Barishal (55.1 percent) reported the lowest, reported loss of learning to be 'a lot'. The level of perception of 'a lot' of loss of learning at different of children's education level primary (69.0 percent), lower secondary (74.8 percent) and upper secondary (75.5 percent) are not very different than the overall levels.

Regarding perception of parents of school going children about online learning during the pandemic while comparing with that of classroom learning before the pandemic, 64 percent are of the view that online learning was 'very less' in nature, while 24.8 percent considered it as 'less' and less than 1 in 10 parents view it as 'average' (8.7 percent), irrespective of the level of education of the child. Although no marked differences by sex of child and other major background dimensions exist, divisions have considerable variations with respect to the parents' views. Sylhet (77.6 percent) has the highest and Barishal, the lowest (51.3 percent) of parents who are of the opinion that online learning was 'very less' compared to the classroom learning. Also, similar perception levels about online learning exist across different education levels. The perception of parents that online learning was 'very less', was not too different across different levels of education of school children (primary: 61.5 percent; lower secondary: 66.7 percent; and upper secondary: 66 percent of children's parents). (Table LN.5.10)

Table LN.5.11 provides percentages of school going children’s mothers/caregivers by some measures/support that they think could be taken/provided to continue children’s attendance in educational institutions in the 2021 school year. Support from the government is conceived as the most important measure that the respondents (83.4 percent, overall) mentioned to continue attendance. Tuition fee support (35.3 percent), provision of free books/education materials (26.9 percent) and enhancing the scope of internet use (31.5 percent) are other noteworthy measures in this respect. ‘Government’s support’ is considered as the most important support among all the measures and is seen to be higher in rural area (85 percent) compared to that in urban area (77.9 percent). Notably, higher percentage of children whose mothers have secondary education consider ‘Government’s support’ as the most important measure (88 percent), compared to mothers having primary (79.6 percent). By wealth index quintile, children in the poorest households (94.2%) consider ‘Government support’ as the most important measure compared to those in the second and higher quintiles of households (71.4 to 88.8 percent). (Table LN.5.11).

Table LN.5.11: Measures to continue attendance in educational institutions

Percentage of school going children or their mothers/caregivers by opinion on measures that could be taken to continue children’s attendance in educational institutions in the 2021 school year, Survey on Children’s Education in Bangladesh 2021

Nature of measures/support	Total	Area		Education level				Wealth index quintile

Table LN.5.12 to Table LN.5.18 provide information on school going children’s and youth (5-24 years) psychological traits which might be affected by long term school closure due to COVID-19. The tables contain information on their feelings during the school closure that included loneliness, worry, depression, nervousness, inferiority complex, irritation and over pressure of homework.

Data suggest that overall, around 20-30 percent of the children and youth felt any of the issues (problems) or stresses mentioned above.

Table LN.5.12 shows that as high as 38 percent of the children and youth felt loneliness during the school closure, where 3.3 percent felt it mostly or always, 18.6 percent felt it sometimes, and 16.1 percent, rarely.

The percentages of children and youth who felt nervous are about 18.7 percent, of which, 12.4 percent felt it rarely while 5.7 percent felt it sometimes and less than 1 percent, felt it mostly or always (Table LN.5.13). Similarly, about 1 in 6 of them (18.2 percent) felt worried, of which only 0.8 percent felt it mostly or always, 8.7 percent, sometimes, and 8.8 percent felt it rarely (Table LN.5.14).

Similarly, a little over 1 in 4 children and youth (27.7 percent) felt depressed during school closure. While only 1.1 percent felt depressed mostly or always, 10.5 percent felt depressed sometimes, and 16.2 percent rarely. (Table LN.5.15). Children and youth (5-24 years) who had the feeling of inferiority complex during school closure was 15.2 percent, of which little less than 1 percent (0.6) felt it mostly, 5.6 percent, sometimes and 9 percent rarely had this feeling. (Table LN.5.16).

About 3 in 10 (29.4 percent) children and youth (5-24 years) felt irritated during the school closure. Of them about 1.5 percent felt it mostly or always, 13.4 percent sometimes and 14.6 percent felt it rarely (Table LN.5.17). Finally, children and youth feeling over-pressure of homework was about 19.4 percent - 1.3 percent mostly or always, 8.3 percent felt it sometimes and, 9.7 percent rarely felt under over pressure. (Table LN.5.18).

The pattern is more or less similar across all background dimensions for all psychological traits (problems) or stresses listed.

Table LN.5.12: Feeling loneliness during school closure

Percentage of 5-24 years children and youth who felt loneliness during school closure for COVID-19, Bangladesh, 2021

5. Protected from violence and exploitation

5.1. Child discipline

Teaching children self-control and acceptable behaviour is an integral part of child discipline in all cultures. Positive parenting practices involve providing guidance on how to handle emotions or conflicts in manners that encourage judgment and responsibility and preserve children's self-esteem, physical and psychological integrity and dignity. However, too often, children are raised using punitive methods that rely on the use of physical force or verbal intimidation to obtain desired behaviour. Studies³⁵ have found that exposing children to violent discipline has harmful consequences, which range from immediate impacts to long-term harm that children carry forward into adult life. Violence hampers children's development, learning abilities and school performance; it inhibits positive relationships, provokes low self-esteem, emotional distress and depression; and, at times, it leads to risk taking and self-harm.

In the Survey on Children's Education 2021, mothers or caregivers of children age 5-14 years were asked a series of questions on the methods which adults in the household used to discipline the child during the past one month before the survey and if the respondent believes that physical punishment is a necessary part of child-rearing. Tables PR.1.1 and PR.1.2 present the results.

For the most part, households employ a combination of violent disciplinary practices, which reflects caregivers' motivation to control children's behaviour by any means possible. Table PR.6.1 shows that majority of the children age 5-14 years (76.6 percent) were subjected to at least one form of violent discipline (psychological or physical punishment) by household members during one month preceding the survey. Children mostly experienced psychological aggression (73.9 percent), while almost every 1 in 2 (46.8 percent) received any form of physical punishment. About 19.4 percent of children were subjected to the 'severe' forms of physical punishment, such as hitting the child on the head, ears or face or hitting the child hard and repeatedly. Practice of non-violent discipline was quite less frequent (11.7 percent). Although children in urban and rural areas had almost no variation, boys were subjected more frequently than girls to any form of physical disciplining (50.9 and 42.6 percent, respectively). Further, a small to moderate variations exist across all other key background characteristics with respect to any violent discipline method. However, divisions had a considerable difference across them, ranging from 59.5 percent in Barishal to 87.5 percent in Rangpur. Although no clear pattern by most background characteristics, practice of violent discipline method is seen to have an inverse relationship with mother's education where it reduces with increasing levels of mother's education (from 78.1 percent for mothers with pre-school or no education and to 66.7 percent for mothers with higher education). Nevertheless, non-violent discipline was more frequent among mothers with higher education and richer households.

[1] MICS indicator PR.2 - Violent discipline; SDG 16.2.1						

Table PR.6.2 shows attitude that 41.1 percent of mothers or caregivers of children age 5-14 years towards physical punishment. About 41.1 percent of mothers or caregivers believe that physical punishment is needed to bring up, raise or educate a child properly. This proportion is very close among mothers of boys and girls and those of urban and rural children. However, divisions show remarkable variations where Chattogram has the highest at 59.5 percent and Barishal, the lowest, 27.8 percent. A moderate variation exists with respect to mother's age, ranging from a low of 36.4 percent for mothers age 50+ years to 41.8 percent for mothers age 25-34 years. There is an apparent inverse relationship between believing in physical punishment with that of mother's education and household wealth status, the belief in physical punishment goes down with the higher levels of mother's education and household wealth.

5.2. Child marriage

Marriage before the age of 18 years is violation of human rights, yet remains a reality for many children. The right to 'free and full' consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be 'free and full' when one of the parties involved is not sufficiently mature to make an informed decision about a life partner. In the Sustainable Development Goals, child marriage has been identified as a harmful practice, which the world should aim to eliminate by 2030.

Child marriage is more common among girls than boys, but it occurs around the world among children of both sexes. The impacts specific to boys married in childhood are not yet well understood, but marriage places boys in an adult role accompanied by responsibilities for which they may not be prepared.

In many parts of the world parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage compromises the development of girls and often results in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty.³⁶

Closely related to the issue of child marriage is the age at which sexual activity – and for females, childbearing – may begin. Women who were married before the age of 18 tend to have more children than those who marry later in life and young women are less likely to receive maternal healthcare services.^{37, 38} Pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19.

Table PR.2.1W presents the percentage of women age 15-24 years married before ages 15 and 18 years. The table also presents the proportion of women who were first married or entered into a marital union before the age of 15 and 18 years by area and age groups and causes of marriage before 18. Examining the percentages married before ages 15 and 18 across different age groups allow for trends to be observed in child marriage over time.

Although the Government of Bangladesh passed a law in 2017 (the Child Marriage Restraint Act 2017) replacing a similar law of 1929, to control the child marriage in Bangladesh, it occurs recurrently. Data show

³⁶ Bajracharya, A. and N. Amin, S. Poverty, marriage timing, and transitions to adulthood in Nepal: A longitudinal analysis using the Nepal living standards survey. that, among young women age 15-24 years, 9.1 percent are married before age 15, and among women age 20-24 years, 11.2 percent are married before age 15, while 40.7 percent are married before age 18. Again, one third (33.1 percent) of younger women age 15-19 years are currently married, showing early marriage proportions; this proportion is slightly higher in rural (34.2 percent) than urban (29.4 percent) areas and is strongly negatively related to the level of mother's education (44.2 percent among those whose mothers have primary education against 28.4 percent for those whose mothers have higher education).

Finding a suitable groom is the main reason for marrying before 18 (81.2 percent). Social practice (23.6 percent), economic hardship (20.1 percent) and upholding family honour (18.5 percent) are some other notable causes. The pattern in 'reasons' appears to be consistently similar across different background parameters. For example, finding a suitable groom is consistently the most important cause (over 70 percent of respondents across all background dimensions mentioned this cause for getting married below age 18). School closure due to COVID-19 as a reason for child marriage accounted for overall 5.1 percent cases, where it was high at 19.3 percent among children aged 15-17 years and low at 4.1 percent among adolescents aged 18-19 years (Table SPR2.1W).

6. Equitable chance in life

6.1 Child functioning

The United Nations formed the Washington Group on Disability Statistics to address the need for cross-nationally comparable disability statistics as well as equalization of opportunity. A person who faces functional difficulties, may have activity limitation, which challenges him/her in carrying out activities. People's functional issues may have been caused by their health conditions in general. Diseases or illnesses, as well as other health issues such as short- or long-term injuries, mental or emotional issues, are all examples of health conditions.

The Convention on the Rights of Persons with Disabilities³⁹ outlines States' obligations to ensure the full realization of rights for children with disabilities on an equal basis with other children. But the presence of functional difficulties may place children as well as adults at risk of experiencing limited participation in an unaccommodating environment and limit the fulfilment of their rights. A person with difficulty in functioning may have activity limitations. Functional difficulty is defined as having 'Some difficulty' or 'A lot of difficulty' or 'Cannot do at all' with one or more of the followings: vision, hearing, mobility (walking or climbing steps), cognition (memory and concentration), self-care and communication⁴⁰.

The Washington Group on Disability Statistics measures functional difficulties by asking a set of questions, which are as follows, 1) Do you have difficulty seeing even if wearing glasses? 2) Do you have difficulty hearing even if using a hearing aid? 3) Do you have difficulty walking or climbing stairs? 4) Do you have difficulty remembering or concentrating? 5) Do you have difficulty with self-care (such as washing all over or dressing)? 6) Using your usual (customary) language, do you have difficulty communicating (for example understanding or being understood by others)? For each question respondents can choose: a) no difficulty, b) some difficulty, c) a lot of difficulty, or d) Cannot do at all.

The Survey on Children's Education 2021 includes child functioning module for children age 5-17 years, which is intended to provide estimates of children with functional difficulties as reported mostly by children's mothers or primary caregivers. Functional domains covered in the module include: seeing, hearing, walking, selfcare, communication, learning, remembering, concentrating, accepting changes, controlling behaviour, making friends, anxiety and depression. Respondents were asked about functional difficulty of any child of the household, and if so, type of functional difficulty he/she has.

Functional difficulty for population is defined as having responded "A lot of difficulty" or "Cannot do at all" to questions within all listed domains, except the domain of controlling behaviour, for which the response category of "A lot more" is considered to be a functional difficulty.

Table EQ.1.1 presents percentages of children age 5-17 years who have functional difficulty in at least one domain of functional difficulties. It shows that 4.2 percent of children age 5-17 years have functional difficulties in at least one of the listed domains based on the Washington Group on Disability Statistics module (as listed before); this percentage is a little higher among boys (4.8 percent) than girls (3.6 percent). Urban children face more functional difficulty (5.3 percent) than among rural children (3.9 percent). This pattern also reflected by the sex of the child, i.e., urban boys and girls have a little higher functional difficulty than their rural counterparts. There are disparities at the division level with Khulna showing the highest rate of functional difficulties (4.9 percent) and Barishal, the lowest rate (3.4 percent). Proportion of children with functional difficulties slightly decreases with increase in child's age, as it varies between 3.6 percent for children age 15-17 years to 4.9

Table EQ.1.2 presents percentage of children age 5-17 years who use assistive devices and have functional difficulties within domain of assistive devices. The survey that among these children, 2.3 percent wear glasses, 0.5 percent use hearing aid and 0.4 percent use equipment or receive assistance for walking.

Further, among children who wear glasses, 2.7 percent have difficulty seeing even after wearing glasses; of the children using hearing aid, 6.9 percent have difficulty hearing even after using hearing aid, and among children using equipment or receiving assistance for walking, 28.8 percent have difficulty walking even after using equipment or receiving assistance. No consistent area difference exists but in all three domains sex differentials suggest that boys have higher levels of functional difficulties even when using assistive devices, than girls: 3.8, 7.2 and 37.7 percent of boys vs. 1.7, 6.2 and 20.9 percent of girls, respectively, report such difficulties. Note that numbers of cases for all three domains are very small especially when we consider them for different household characteristics. These estimates need to be used carefully (Table EQ.1.2).

Table EQ.1.2: Use of assistive devices
Percentage of children age 5-17 years who use assistive devices and have functional difficulty within domain of assistive devices, Bangladesh, 2021

	Percentage of children age 5-17 years who:			Number of children age 5-17 years	Percentage of children with difficulty seeing when wearing glasses	Number of children age 5-17 years who wear glasses	Percentage of children with difficulty hearing when using hearing aid	Number of children age 5-17 years who use hearing aid	Percentage of children with difficulty walking when using equipment or receiving assistance	Number of children age 5-17 years who use equipment or receive assistance for walking

FL20. শিশুর পড়ার ফলাফল।	শেষ কত তম শব্দ পর্যন্ত চেষ্টা করেছে..... সংখ্যা ___						
	ভুল পাঠ করা বা বাদ পড়া শব্দের মোট সংখ্যা সংখ্যা ___						
FL21. শিশুটি কতটা ভালভাবে গল্পটি পড়েছে?	শিশুটি কমপক্ষে একটি শব্দ ঠিকভাবে পড়েছে..... 1						2⇒FL23 3⇒FL23
	শিশুটি কোনো শব্দই ঠিকভাবে পড়তে পারেনি 2						
	শিশুটি গল্পটি পড়ার চেষ্টাই করেনি 3						
FL22. তুমি যা পড়েছ এখন তা নিয়ে আমি তোমাকে কিছু প্রশ্ন করব।							
<p>যদি শিশুটি কয়েক সেকেন্ড যাওয়ার পরও কোনো উত্তর না দেয় তাহলে আবার বলুন। যদি প্রশ্নটি আবার বলার পরও যদি শিশুটি কোনো উত্তর দিতে পারবে না বলে মনে হয় তাহলে 'কোনো উত্তর দেয়নি' এর কোড লিখুন এবং বলুন: তোমাকে ধন্যবাদ। ঠিক আছে। আমরা এগিয়ে যাই।</p> <p>শিশুটি এখনও গল্পটি দেখতে পাচ্ছে- তা নিশ্চিত করুন এবং ডিজ্জেস করুন:</p>							
[A] মুসা কোন ক্লাস/শ্রেণিতে পড়ে?	ঠিক (মুসা দ্বিতীয় শ্রেণিতে পড়ে)1						
	ভুল2						
	কোনো উত্তর দেয়নি/বলেছে 'আমি জানি না'.....3						
[B] মুসা বাড়িতে ফেরার পথে কি দেখতে পেয়েছে?	ঠিক (সে কিছু ফুল দেখতে পায়)1						
	ভুল2						
	কোনো উত্তর দেয়নি/বলেছে 'আমি জানি না'.....3						

<p>[C] কেন মুসা কান্না করতে শুরু করে?</p>	<p>ঠিক (কারণ সে পড়ে গিয়েছিল)1 ভুল2 কোনো উত্তর দেয়নি/বলেছে 'আমি জানি না'.....3</p>	
<p>[D] কোথায় মুসা পড়ে গিয়েছে?</p>	<p>ঠিক (মুসা একটি কলা গাছের কাছে পড়ে গিয়েছে)1 ভুল2 কোনো উত্তর দেয়নি/বলেছে 'আমি জানি না'.....3</p>	
<p>[E] কেন মুসা খুশি হয়েছে?</p>	<p>ঠিক (কারণ কৃষক তাকে অনেক ফুল দেন/কারণ সে তার মাকে দেয়ার মতো ফুল পেয়েছে)1 ভুল2 কোনো উত্তর দেয়নি/বলেছে 'আমি জানি না'.....3</p>	
<p>FL23. পড়া ও গণনার বই-এর পৃষ্ঠা উল্টান যেন শিশুটি সংখ্যার তালিকাটি দেখতে পায়। শিশুটি পৃষ্ঠার দিকে তাকাচ্ছে কি না নিশ্চিত করুন।</p> <p>এখানে কিছু সংখ্যা আছে। আমি তোমাকে প্রত্যেকটি সংখ্যা দেখাচ্ছি। সংখ্যাগুলো কত আমাকে তুমি বলো।</p> <p>প্রথম সংখ্যাটি দেখিয়ে বলুন:</p> <p>এখান থেকে শুরু করো।</p> <p>যদি কোনো একটি সংখ্যায় শিশু অনেকক্ষণ থেমে থাকে, তাহলে সংখ্যাটি কত তা শিশুটিকে বলুন। 'কোনো চেষ্টা করেনি'-এর কোড লিখুন। পরবর্তী সংখ্যাটি দেখান এবং বলুন:</p> <p>সংখ্যাটি কত?</p> <p>থেমে যাওয়ার নিয়মঃ</p> <p>যদি শিশুটি পরপর দুটি সংখ্যা পড়ার চেষ্টা না করে, তাহলে বলুনঃ</p> <p>তোমাকে ধন্যবাদ। ঠিক আছে। আমরা পরবর্তী কাজে যাই।</p>	<p>৯ ঠিক 1 ভুল 2 কোনো চেষ্টা করেনি 3</p> <p>১২ ঠিক 1 ভুল 2 কোনো চেষ্টা করেনি 3</p> <p>৩০ ঠিক 1 ভুল 2 কোনো চেষ্টা করেনি 3</p> <p>৪৮ ঠিক 1 ভুল 2 কোনো চেষ্টা করেনি 3</p> <p>৭৪ ঠিক 1 ভুল 2 কোনো চেষ্টা করেনি 3</p> <p>৭৩১ ঠিক 1 ভুল 2 কোনো চেষ্টা করেনি 3</p>	
<p>FL23A. FL23 যাচাই করুন: শিশুটি কি প্রথম তিনটি সংখ্যার (অর্থাৎ ৯, ১২ ও ৩০ এর) মধ্যে দুটি সংখ্যা ঠিকভাবে চিহ্নিত করতে পেরেছে?</p>	<p>হ্যাঁ, কমপক্ষে দুটি ঠিক1 না, কমপক্ষে দুটি ভুল বা কোনো চেষ্টা করেনি..... 2</p>	<p>2⇒FL28</p>

<p>FL24. এমনভাবে পৃষ্ঠা উল্টান যেন শিশুটি প্রথম জোড়া সংখ্যা দেখতে পায়। শিশুটি এই পৃষ্ঠার দিকে তাকাচ্ছে-এটা নিশ্চিত করুন। তারপর বলুন:</p> <p>এই সংখ্যাগুলোর দিকে তাকাও। কোনটি বড় বলো।</p> <p>বইয়ের পৃষ্ঠা উল্টানোর আগে এবং পরবর্তী জোড়া সংখ্যার জন্য প্রশ্নটি আবার বলার আগে শিশুর উত্তর লিপিবদ্ধ করুন।</p> <p>যদি শিশুটি কিছু সময় পরও কোনো উত্তর না দেয় তাহলে প্রশ্নটি আবার বলুন। যদি প্রশ্নটি আবারও বলার পর শিশুটি কোনো উত্তর দিতে পারবে না বলে মনে হয় তাহলে প্রশ্নপত্রের যথাযথ সারিতে (স্থানে) উত্তরের জন্য 'Z' লিখুন। বুকলেটের পরবর্তী পৃষ্ঠায় যান এবং শিশুটিকে পরবর্তী জোড়া সংখ্যা দেখান।</p> <p>যদি শিশুটি পরপর দুটি জোড়া সংখ্যা বলার চেষ্টা না করে তাহলে বলুন:</p> <p>তোমাকে ধন্যবাদ। ঠিক আছে। আমরা পরবর্তী কাজে যাই।</p>	<p>৭ ৫ —</p> <p>১১ ২৪ —</p> <p>৫৮ ৪৯ —</p> <p>৬৫ ৬৭ —</p> <p>১৪৬ ১৫৪ —</p>	
<p>FL25. শিশুটিকে একটি পেন্সিল ও কাগজ দিন। পৃষ্ঠাটি এমনভাবে উল্টান যেন শিশুটি প্রথম যোগ অংকটি দেখতে পায়। শিশুটি পৃষ্ঠাটির দিকে তাকাচ্ছে তা নিশ্চিত করুন। বলুন:</p> <p>যোগ অংকটি দেখো। দুটি সংখ্যার যোগফল কত হবে? উত্তরটি বলো। দরকার হলে তুমি পেন্সিল ও কাগজ বা আঙ্গুল ব্যবহার করতে পারো।</p> <p>বইয়ের পরবর্তী পৃষ্ঠায় যাওয়ার আগে এবং পরবর্তী অংকের জন্য প্রশ্নটি আবার বলার আগে শিশুটির উত্তর (ফলাফল) লিপিবদ্ধ করুন।</p> <p>যদি শিশুটি কিছুক্ষণ পরও কোনো উত্তর না দেয় তাহলে প্রশ্নটি আবার বলুন। যদি প্রশ্নটি আবারও বলার পর শিশুটি কোনো উত্তর দিতে পারবে না বলে মনে হয় তাহলে প্রশ্নপত্রের যথাযথ সারিতে (স্থানে) উত্তরের জন্য 'Z' লিখুন। তারপর বুকলেটের পরবর্তী পৃষ্ঠায় যান এবং শিশুটিকে পরবর্তী অংশ (যোগ অংকটি) দেখান।</p> <p>যদি শিশুটি পরপর দুটি জোড়া সংখ্যা যোগ করার চেষ্টা না করে তাহলে বলুন:</p> <p>তোমাকে ধন্যবাদ। ঠিক আছে। আমরা পরবর্তী কাজে যাই।</p>	<p>৩ + ২ = —</p> <p>৮ + ৬ = —</p> <p>৭ + ৩ = —</p> <p>১৩ + ৬ = —</p> <p>১২ + ২৪ = —</p>	

FL26. বাদ পড়া সংখ্যার জন্য অনুশীলন শিটের পৃষ্ঠায় যান। বলুন:

এখানে কিছু সংখ্যা আছে। ১, ২ এবং ৪। এখানে এর মাঝে কোন্ সংখ্যাটি বসবে?

যদি শিশুটি উত্তর ঠিকভাবে দিতে পারে তাহলে বলুন:

৩, উত্তরটি ঠিক। চলো, অন্য একটি করি।

যদি শিশুটি ভুল উত্তর দেয় তাহলে শিশুটি কিভাবে সঠিক উত্তর বের করা যায় তা ব্যাখ্যা করবেন না। শুধু বলুন:

এখানে ৩ বসবে। সংখ্যাগুলো আমার সাথে বলো: (প্রত্যেকটি সংখ্যার দিকে দেখান) ১, ২, ৩, ৪।

এখানে ৩ বসবে। চলো আরেকটা করবে।

এখন পরবর্তী অনুশীলন শিটে যাওয়ার জন্য পৃষ্ঠা উল্টান। বলুন:

এখানে আরো কিছু সংখ্যা আছে। ৫, ১০, ১৫ ও ----। এখানে কোন্ সংখ্যা বসবে?

যদি শিশুটি উত্তর ঠিকভাবে দিতে পারে তাহলে বলুন:

২০, উত্তরটি ঠিক। এখন আমি চাই তুমি নিজে নিজে এটি করো।

যদি শিশুটি ভুল উত্তর দেয় তাহলে বলুন:

এখানে ২০ বসবে। সংখ্যাগুলো আমার সাথে বলো (প্রত্যেকটি সংখ্যার দিকে দেখান) ৫, ১০, ১৫, ২০।

এখানে ২০ বসবে। এখন আমি চাই তুমি নিজে নিজে এটি করো।

FL27. প্রদত্ত 'রিডিং' ও 'নাম্বার বুক'-এর বাদ পড়া সংখ্যা চিহ্নিত করা অংশের প্রথম পৃষ্ঠাটি উল্টান। বলুন:

এখানে আরো কিছু সংখ্যা আছে। আমাকে বলো এখানে (বাদ পড়া সংখ্যার স্থানটি দেখান) কোন্ সংখ্যা বসবে।

৫ ৬ ৭ —

১৪ ১৫ — ১৭

বইয়ের পরবর্তী পৃষ্ঠায় যাওয়ার আগে এবং প্রশ্নটি আবার বলার আগে শিশুটির উত্তর (ফলাফল) লিপিবদ্ধ করুন।

২০ — ৪০ ৫০

যদি শিশুটি কিছুক্ষণ অপেক্ষার পরও কোনো উত্তর না দেয় তাহলে প্রশ্নটি আবার বলুন। যদি প্রশ্নটি আবারও বলার পর শিশুটি কোনো উত্তর দিতে পারবে না বলে মনে হয় তাহলে প্রশ্নপত্রের যথাযথ সারিতে (স্থানে) উত্তরের জন্য 'Z' লিখুন।

২ ৪ ৬ —

৫ ৮ ১১ —

যদি শিশুটি পরপর দুটি কাজ করার চেষ্টা না করে তাহলে বলুন:

তোমাকে ধন্যবাদ। ঠিক আছে।

<p>FL28. শিশুর সাক্ষাৎকারের ফলাফল।</p> <p>কোনো সাক্ষাৎকারে অসম্পূর্ণতা থাকলে (পূর্ণ করা সম্ভব না হলে) তা সুপারভাইজারকে অবহিত করুন।</p>	<p>সাক্ষাৎকার সম্পন্ন হয়েছে.....01</p> <p>বাড়িতে পাওয়া যায়নি.....02</p> <p>মা/লালনপালনকারীর অসম্মতি.....03</p> <p>শিশুটির অসম্মতি..... 04</p> <p>আংশিক সম্পন্ন হয়েছে.....05</p> <p>উত্তর দিতে অসমর্থ.....06</p> <p>অন্যান্য (নির্দিষ্ট করুন)_____</p> <p>96</p>

INTERVIEWER'S OBSERVATIONS

Appendix 2: Key findings from Survey on Children’s Education in Bangladesh 2021 and MICS 2019

The summary table of key findings below presents estimates of different key indicators covered in the Survey on Children’s Education in Bangladesh 2021 and Multiple Indicator cluster Survey (MICS) in Bangladesh 2019 to see the status of the indicators at a glance. Note that MICS 2019 was conducted in a normal situation before COVID-19 outbreak, while the Survey on Children’s Education was conducted during the COVID-19 period when all educational institutions were closed. Thus, results of those two surveys are not comparable in the true sense.

Summary table of key findings from Survey on Children’s Education in Bangladesh (CEB) 2021 and Multiple Indicator Cluster Survey (MICS) 2019								
Survey INDICATORS (MICS related indicators)		Description	CEB 2021			MICS 2019		
			Total	Urban	Rural	Total	Urban	Rural
SR.1	Access to electricity	Percentage of household members with access to electricity	98.7	98.8	98.7	92.2	97.8	90.7
SR.2	Households with a radio	Percentage of households that have a radio	0.6	0.8	0.5	0.6	0.5	0.6

(c) Attending grade 2/3	c) 15.3	c) n.a	c) n.a	c) 12.6	c) n.a	c) n.a		

Appendix 3: Committees

**Programme Implementation Committee (PIC)
Survey on Children's Education in Bangladesh 2021
Bangladesh Bureau of Statistics (BBS)**

SL No.	Name, Designation and Organization (Not According to the Seniority)	Designation in Committee
1.	Director General, Bangladesh Bureau of Statistics (BBS)	Chairperson
2.	Additional Secretary (Admin.), Statistics and informatics Division	Member
3.	Deputy Director General, Bangladesh Bureau of Statistics (BBS)	Member
4.	Line Director, Maternal, Neo natal, Child & Adolescent Health, DG Health	Member
5.	Director (Research), National Institute of Population Research and Training (NIPORT)	Member
6.	Director, FA & MIS, BBS	Member
7.	Deputy Secretary (SDG Cell), Statistics and Informatics Division	Member
8.	Deputy Secretary (Budget), Statistics and Informatics Division	Member
9.	Prof. Muhammad Shuaib, Institute of Statistical Research and Training, Dhaka University	Member
10.	Director, Institute of Statistical Research and Training, Dhaka University	Member
11.	Director, Institute of Nutrition and Food Science, Dhaka university	Member
12.	Chairman, Department of Population Sciences, Dhaka University	Member
13.	Statistics and Monitoring Specialist, UNICEF Bangladesh	Member
14.	Representative, Department of Women and Children Affairs	Member
15.	Representative, Department of Social Services	Member
16.	Representative, Department of Public Health Engineering	Member
17.	Representative, Directorate of Primary Education	Member
18.	Representative, Department of Labour	Member
19.	Chief, Population Planning and Research (PPR), UNFPA	Member
20.	Mr. Md. Sirajul Islam, Emeritus Scientist, ICDDR'B	Member
21.	Director, Demography and Health Wing, BBS	Member Secretary

Working Committee
Survey on Children's Education in Bangladesh 2021
Bangladesh Bureau of Statistics (BBS)

SL No.	Name, Designation and Organization (Not According to the Seniority)	Designation in Committee
1.	Mr. Md. Mashud Alam, Director, Demography and Health Wing, BBS	Chairperson
2.	Dr. Dipankar Roy, Project Director, Household Income and Expenditure Survey (HIES) Project, BBS	Member
3.	Ms. Mst. Kamrunnahar, Deputy Secretary, Statistics and Informatics Division	Member
4.	Mr. Smaila Gnegne, Statistics and Monitoring Specialist, UNICEF Bangladesh	Member
5.	Professor Muhammad Shuaib, ISRT, Dhaka University	Member
6.	Mr. Iftekhairul Karim, Deputy Director, Demography and Health Wing, BBS	Member
7.	Ms. Reshma Jesmin, Deputy Director, Census Wing, BBS	Member
8.	Mr. Mashiur Rahman Khan, Statistics and Monitoring Officer, UNICEF Bangladesh	Member
9.	Mr. Md. Monirul Islam, Statistical Officer, Demography and Health Wing, BBS	Member
10.	Mr. Md. Lutfor Rahman, Statistical Officer, Demography and Health Wing, BBS	Member
11.	Mr. Md. Mahabub Alam, Statistical Officer, Demography and Health Wing, BBS	Member
12.	Ms. Fahmida Ferdous, Statistical Officer, Census Wing, BBS	Member
13.	Ms. Nilufa Khondker, Statistical Officer, Demography and Health Wing, BBS	Member
14.	Ms. Asma Akhter, Deputy Director, Demography and Health Wing, BBS	Member Secretary

Report Review Committee
Survey on Children's Education in Bangladesh 2021
Statistics and Informatics Division (SID)

SL No.	Name, Designation and Duty Station (Not According to Seniority)	Designation in Committee
1.	Additional Secretary, Informatics, SID, Ministry of Planning	Convenor
2.	Joint Secretary, Budget, Financial Management & Audit and ICT, SID	Member
3.	Joint Secretary, Informatics, SID	Member
4.	Deputy Secretary, Development-2, SID	Member
5.	Deputy Secretary, Informatics-1, SID	Member
6.	Senior Assistant Secretary, Coordination and Reforms, SID	Member
7.	Focal Point Officer, Survey on Children's Education in Bangladesh 2021, Demography and Health Wing, BBS	Member
8.	Deputy Director, RDP Section, BBS	Member
9.	Senior Assistant Secretary, Informatics-2, SID	Member Secretary

Editor's Forum
Survey on Children's Education in Bangladesh 2021
Bangladesh Bureau of Statistics (BBS)
