The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the Global MICS Programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), with government funding and financial support of UNICEF, the Royal Norwegian Embassy (RNE), German Agency for International Cooperation (GIZ), Global Alliance for Vaccines and Immunizations (GAVI) and the United States Agency for International Development (USAID).

The Global MICS Programme was developed by UNICEF in the 1990s as an international multi-purpose household survey programme to support countries in collecting internationally comparable data on a wide range of indicators on the situation of children and women. MICS surveys measure key indicators that allow countries to generate data for use in policies, programmes, and national development plans, and to monitor progress towards the Sustainable Development Goals (SDGs) and other internationally agreed upon commitments.

The basic objective of the MICS 2019-20 is to provide information on indicators for monitoring progress of attainment of the Millennium Development Goals and Malawi Growth and Development Strategy and other development programmes. Through collection and calculation of status of indicators of the Millennium Development Goals and other key social statistics indicators, the MICS data will also be used to update the socio-economic database for policy and research.

The objective of this report is to facilitate the timely dissemination and use of results from the Malawi MICS. The report contains detailed information on the survey methodology, and all standard MICS tables. The report is accompanied by a series of Statistical Snapshots of the main findings of the survey.

For more information on the Global MICS Programme, please go to mics.unicef.org.

Key Messages

- The response rates for households, eligible women, children 5-17 years and under 5 were outstanding (95% and above) while that for men was satisfactory at 88%
- The population pyramid is broad based indicating a high proportion of population was young
- Of the children under 18 years, 17% were living with neither biological parent and 28% were living with biological mother only
- Two thirds of the women (62%) were married or in union compared to 54% of men
- A third of the households were female headed
Adolescence is by some measures the healthiest period in the life-course, yet it can also mark the first manifestations of issues which can have lifelong effects on health and wellbeing, such as unsafe sexual behavior, early childbearing and substance misuse. Nevertheless, health interventions during this period are shown to have long-lasting effects. Access to appropriate contraceptive methods is critical to prevent adolescent pregnancy and its related consequences, allowing adolescents to transition into adulthood with the ability to plan their pregnancies and live healthy and productive lives.

This snapshot of adolescent well-being is organized around key priority areas for adolescents:

- Every adolescent survives and thrives
- Every adolescent learns
- Every adolescent is protected from violence and exploitation
- Every adolescent lives in a safe and clean environment
- Every adolescent has an equitable chance in life

Adolescence is by some measures the healthiest period in the life-course, yet it can also mark the first manifestations of issues which can have lifelong effects on health and wellbeing, such as unsafe sexual behavior, early childbearing and substance misuse. Nevertheless, health interventions during this period are shown to have long-lasting effects. Access to appropriate contraceptive methods is critical to prevent adolescent pregnancy and its related consequences, allowing adolescents to transition into adulthood with the ability to plan their pregnancies and live healthy and productive lives.

**Every Adolescent Survives & Thrives**

Adolescence is by some measures the healthiest period in the life-course, yet it can also mark the first manifestations of issues which can have lifelong effects on health and wellbeing, such as unsafe sexual behavior, early childbearing and substance misuse. Nevertheless, health interventions during this period are shown to have long-lasting effects. Access to appropriate contraceptive methods is critical to prevent adolescent pregnancy and its related consequences, allowing adolescents to transition into adulthood with the ability to plan their pregnancies and live healthy and productive lives.

**Adolescent Birth Rate; SDG 3.7.2**

Age-specific fertility rate for girls age 15-19 years: the number of live births in the last 3 years, divided by the average number of women in that age group during the same period, expressed per 1,000 women

Data for adolescent’s education, category “higher” are based on 25-49 unweighted cases

**Modern Contraceptive Use, Unmet Need & Demand Satisfied for Modern Methods: SDG 3.7.1**

Percentage of girls age 15-19 years who are using (or whose partner is using) a contraceptive method, percentage with an unmet need for contraception and percent of demand for modern methods of family planning satisfied, by marital status
Every Adolescent Survives & Thrives

Tobacco* & Alcohol Use

Alcohol and tobacco use typically have their onset in adolescence and are major risk factors for adverse health and social outcomes, as well as for non-communicable diseases later in life. Adolescence is a time of heightened risk-taking, independence seeking and experimentation. Adolescents are at increased risk of substance use due to social, genetic, psychological or cultural reasons. Yet adolescence is also an opportune time for education on the negative consequences of substance use, and promote healthy behaviours that will last into adulthood.

Every Adolescent Learns

Foundational Reading Skills

Percentage of children age 10-14 who can 1) read 90% of words in a story correctly, 2) Answer three literal comprehension questions, and 3) Answer two inferential comprehension questions

Foundational Numeracy Skills

Quality education and experiences at school positively affect physical and mental health, safety, civic engagement and social development. Adolescents, however, can also face the risk of school drop-out, early marriage or pregnancy, or being pulled into the workforce prematurely.

Data on reading and numeracy skills are collected in MICS through a direct assessment method. The Foundational Learning module captures information on children’s early learning in reading and numeracy at the level of Grade 2 in primary education.

School Attendance Rates

Adjusted net attendance rate, by level of education and by gender

Information & Communications Technology (ICT) Skills*

Percentage of girls age 15-19 who have performed at least one of nine specific computer related activities

Percentage of boys age 15-19 who in the last 3 months have performed at least one of nine specific computer related activities

*Age disaggregate of SDG 4.4.1: Proportion of youth and adults with information and communications technology (ICT) skills
Adolescence is a period of heightened risk to certain forms of violence and exploitation. The onset of puberty marks an important transition in girls' and boys' lives whereby gender, sexuality and sexual identity begin to assume greater importance, increasing vulnerability to particular forms of violence, particularly for adolescent girls. Certain harmful traditional practices, such as female genital mutilation/cutting and child marriage, often take place at the onset of puberty. At the same time, as children enter adolescence, they begin to spend more time outside their homes and interact more intimately with a wider range of people, including peers and romantic partners. This change in social worlds is beneficial in many respects, but also exposes adolescents to new forms of violence.
Every Adolescent is Protected from Violence & Exploitation

Definition of Child Labour

Age 5 to 11 years: At least 1 hour of economic activities or 21 hours of unpaid household services per week.

Age 12 to 14 years: At least 14 hours of economic activities or 21 hours of unpaid household services per week.

Age 15 to 17 years: At least 43 hours of economic activities. No threshold for number of hours of unpaid household services.

Economic activities include paid or unpaid work for someone who is not a member of the household, work for a family farm or business. Household chores include activities such as cooking, cleaning or caring for children.

Note that the child labour indicator definition has changed during the implementation of the sixth round of MICS. Changes include age-specific thresholds for household chores and exclusion of hazardous working conditions. While the overall concept of child labour includes hazardous working conditions, the definition of child labour used for SDG reporting does not.

Every Adolescent Lives in a Safe & Clean Environment

Water, Sanitation & Clean Fuel Use

The data presented here are at the household level. Evidence suggests that adolescent access to these services are comparable to household-level data.

Basic Drinking Water SDG 6.1.1: Drinking water from an improved source, provided collection time is not more than 30 minutes for a roundtrip including queuing. Improved drinking water sources are those that have the potential to deliver safe water by nature of their design and construction, and include: piped water, boreholes or tubewells, protected dug wells, protected springs, rainwater, and packaged or delivered water.

Basic Sanitation Services SDG 6.1.2: Use of improved facilities which are not shared with other households. Improved sanitation facilities are those designed to hygienically separate excreta from human contact, and include: flush/pour flush to piped sewer system, septic tanks or pit latrines; ventilated improved pit latrines, composting toilets or pit latrines with slabs.

Clean Fuels SDG 7.3.2: Primary reliance on clean fuels and technologies for cooking, space heating and lighting.

Every Adolescent has an Equitable Chance in Life

Discrimination & Harassment

Percentage of adolescent girls and boys age 15-19 years who in the last 12 months have felt discriminated against or harassed on the basis of different grounds.
Every Adolescent has an Equitable Chance In Life

Achieving sustainable progress and results with regard to equity demands a human rights-based approach. At the core of international human rights legal framework is the principle of non-discrimination, with instruments to combat specific forms of discrimination, including against women, indigenous peoples, migrants, minorities, people with disabilities, and discrimination based on race and religion, or sexual orientation and gender identity. As adolescents begin to form more of an individual identity, discrimination can often become more pronounced, taking form in harassment, bullying, or exclusion from certain activities. At the same time, research has shown that discrimination during adolescence has a particularly strong effect on stress hormones, potentially leading to life-long mental or physical health side effects.

Children and adolescents with disabilities are one of the most marginalized groups in society. Facing daily discrimination in the form of negative attitudes, lack of adequate policies and legislation, adolescents with disabilities are effectively barred from realizing their rights to health, education, and even survival.

Key Messages

- Males age 10-19 years constitute 28% of the male population and females 25% of the female population.
- Adolescent birth rate was highest among children living in poorest households (204 births per 1,000 girls) and lowest among children from richest households (60 births per 1,000 girls). Pre-primary or none had a higher birth rate (225 births per 1,000 girls) while those with higher education had a lower birth rate (22 births per 1,000 girls).
- Differences in adolescents birth rate were also observed between urban areas (75 births per 1,000 girls) and rural areas (149 births per 1,000 girls). Adolescents aged 10-14yrs are more competent in numeracy (76%) than reading (26%).
- School attendance rates are higher in primary schools for both boys and girls than in secondary schools.
- Tobacco and alcohol use is higher in boys aged 15-19 than girls of the same age group.

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF). UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Adolescents. Data from this snapshot can be found in tables SR.4.1, SR.9.4W/M, SR.10.1W/M, SR.10.3W/M, TM.2.1, TM.3.3, TM.3.4, LN.2.3, LN.2.4, LN.2.6, LN.4.1, LN.4.2, PR.2.1, PR.3.3, PR.4.1W, WS.3.6, TC.4.7, EQ.1.2 and EQ.3.1W/M in the Survey Findings Report.

Further statistical snapshots and the Summary Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Among children under 5 years, 67% had their birth registered.

Of the children under 5 years, 22% had a birth certificate.

65% of children from the middle households (lowest rate) was likely to be registered compared to 71% from richest households.

Children born to mothers/caregivers with higher education were more likely to be registered (78%) compared to those whose mothers had pre-primary or no education (60%).

At regional level, birth registration was highest among children living in the central region (71%) and lowest in the northern region (58%).

A large proportion (73%) of mothers/caregivers with unregistered children did not know how to register their child’s birth.

- **Urban**: 66 (34)

Percentage of children under age 5 whose births are not registered, by mother’s (or caregiver’s) knowledge of how to register a child

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Birth Registration. Data from this snapshot can be found in table PR.1.1 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Children with disabilities are among the most marginalized groups in society. Facing daily discrimination in the form of negative attitudes, and lack of adequate policies and legislation, they are often likely to be among the poorest members of the population and are less likely to attend school, access medical services, or have their voices heard in society. Discrimination against and exclusion of children with disabilities also puts them at a higher risk of physical and emotional abuse or other forms of neglect, violence and exploitation.

The Convention on the Rights of the Child (UNICEF, 1989) and the Convention on the Rights of Persons with Disabilities (UN, 2006) explicitly state the rights of children with disabilities on an equal basis with other children and call for improvements in their access to services, and in their participation in all aspects of life.

In order to achieve these goals, there is a need for cross-nationally comparable, reliable data. The Child Functioning module is designed in line with the WHO’s International Classification of Functioning, Disability and Health and the UN Convention on the Rights of Persons with Disabilities, to collect information on functional difficulties that children experience in different domains including hearing, vision, communication/comprehension, learning, mobility and emotions. Children with functional difficulties may be at risk of experiencing limited participation in an unaccommodating environment and limit the fulfilment of their rights.

Key Messages

- About 1 in 10 of children age 2-17 years were reported to have at least one functional difficulty.
- The most prevalent domain of functional difficulties among children age 2-4 years was controlling behavior (2%).
- Among children age 5-17 years, anxiety was reported as the most prevalent domain of functional difficulties at 5%.
- Fourteen (14%) of children age 2-17 years living in the poorest households were reported to have a functional difficulty in at least one domain, compared to 9% of children living in the richest households. Functional difficulties are also reported more frequently among children in rural areas and those whose mothers have lower education levels. Only minor differences are noted across regions.
- The use of assistive devices for seeing, hearing and walking was low (less than 1.5%) for all the three domains of functional difficulties.
The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Child Functioning. Data from this snapshot can be found in tables EQ.1.1, EQ.1.2, EQ.1.3, and EQ.1.4 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Malawi 2019-2020

Maternal & Newborn Health

Key Elements of Maternal & Newborn Health

Maternal & Newborn Health Cascade by Area

Timing of First Antenatal Care Visit

Content & Coverage of Antenatal Care Services

Percentage of women age 15-49 years with a live birth in the last 2 years who were attended during their last pregnancy that led to a live birth at least once by skilled health personnel, by the timing of first ANC visit.

Percentage of women age 15-49 years with a live birth in the last 2 years who had their blood pressure measured and gave urine and blood samples, were given at least two doses of tetanus toxoid vaccine within the appropriate interval, took three or more doses of SP/Fansidar to prevent malaria, reported that during an ANC visit they received information or counselling on HIV, and reported that they were offered and accepted an HIV test during antenatal care and received their results during the last pregnancy that led to a live birth.
Coverage of Antenatal Care by Various Characteristics

Key Messages

- Ninety seven percent of women age 15-49 years with a live birth in
  the last two years received antenatal care at least once from a skilled provider
- Only 28% of women had their first antenatal care visit before 4 months of pregnancy
- Among women who received antenatal care, 29% received all 3 key services, i.e. blood pressure measurement (84%), blood sample (93%) and urine testing (32%).
- Women with higher education were more likely to deliver by caesarean section (33%)
- Eighty-four percent of mothers and 88% of newborn babies received postnatal care within 2 days of delivery
- Slightly about 9 in 10 of newborn babies received at least 2 postnatal signal care functions (umbilical cord examination, temperature assessment, breastfeeding counselling or observation, weight assessment, and counselling on danger signs for newborns)
- The proportion of pregnant women with at least 4 antenatal care visits was 51%
- Ninety seven percent of live births took place in health facilities
- Ninety-six percent of women age 15-49 years with a live birth two years preceding the survey were delivered by skilled personnel (99% in urban areas and 96% in rural areas)
- Eight percent of live births were by caesarean section

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF). UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Maternal and Newborn Health. Data from this snapshot can be found in tables TM.4.1, TM.4.2, TM.4.3, TM.5.1, TM.6.1, TM.6.2, TM.8.2, TM.8.4, TM.8.5, TM.8.6, TM.8.7, TM8.9 TM.11.5, TC.6.9 and TC.7.1 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Types of Child Discipline

Percentage of children age 1 to 14 years who experienced any discipline in the past month, by type

Violent Discipline: Inequalities

Percentage of children aged 1 to 14 years who experienced any violent discipline in the past month, by background characteristics

Key Messages

- Physical punishment on children peaked at the age cohort 3-4 years
- Eighty-two percent of all children aged 1-14 years were subjected to at least some form of violent discipline
- Sixteen percent of the mothers/caretakers thought that physical punishment is necessary for disciplining children
- There were no noticeable differences among mothers/caregivers who thought that physical punishment was necessary to raise or educate children in respect of their background characteristics (wealth, education, age group, area and sex)
- Similarly, exposure to violent discipline, is generally high and doesn’t vary across areas, wealth quintile and sex of the child.
- Children whose mother has a primary education or less are more exposed (83%) to violent discipline compared to children whose mother has higher education level (73%)

Physical punishment: Shaking, hitting or slapping a child on the hand/arm/leg, hitting on the bottom or elsewhere on the body with a hard object,spanking or hitting on the bottom with a bare hand, hitting or slapping on the face, head or ears, and hitting or beating hard and repeatedly.

Severe physical punishment: Hitting or slapping a child on the face, head or ears, and hitting or beating a child hard and repeatedly.

Psychological aggression: Shouting, yelling or screaming at a child, as well as calling a child offensive names such as ‘dumb’ or ‘lazy’.

Violent discipline: Any physical punishment and/or psychological aggression.
**Violent Discipline: Age Patterns**

Percentage of children age 1 to 14 years who experienced any violent discipline in the past month, by type and by age.

**Physical Punishment: Attitudes & Experiences**

Percentage of mothers/caretakers who think that physical punishment is necessary.

Percentage of children age 1-14 years who experienced any physical punishment.

**Attitudes to Physical Punishment**

Percentage of mothers/caretakers who think that physical punishment is necessary to raise or educate children, by their background characteristics.

---

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Child Discipline. Data from this snapshot can be found in tables PR.2.1 and PR.2.2 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Malawi MICS Snapshots of Key Findings

Child Health & Care of Illness

**Diarrhoea**

**Care-seeking for Diarrhoea**

- Public: 52%
- Private: 8%
- CHAM/Mission: 2%
- Community: 7%
- Other provider: 6%

A health facility or provider: 58%

**Disparities in Care-seeking for Diarrhoea**

- Male, 58%
- Rural, 59%
- Female, 59%
- Urban, 54%
- Middle, 64%
- Fourth, 55%
- Lower Secondary, 61%
- Higher, 42%

**Feeding during Diarrhoea**

- Eating: 9% (Nothing), 23% (Much less), 30% (Somewhat less), 30% (About the same), 8% (More)
- Drinking: 6% (Nothing), 19% (Much less), 23% (Somewhat less), 30% (About the same), 20% (More)

**ORS Treatment for Diarrhoea**

- Percentage of children age 0-59 months with diarrhoea in the last two weeks treated with oral rehydration salt solution (ORS): 51%

**ORS + Zinc Treatment for Diarrhoea**

- Percentage of children age 0-59 months with diarrhoea in the last two weeks treated with oral rehydration salt solution (ORS) and zinc: 22%

**ORT + Continued Feeding for Diarrhoea**

- Percentage of children age 0-59 months with diarrhoea in the last two weeks who were given oral rehydration therapy (ORT) with continued feeding: 41%
Malaria

Household Availability of Insecticide Treated Nets (ITNs)

Percentage of households with at least one insecticide-treated net (ITN)

Malawi MICS Snapshots of Key Findings

Children Under-Five who slept under an ITN

Percentage of children age 0-59 months who slept under an ITN last night

Care-seeking during Fever

Percentage of children age 0-59 months with fever in the last two weeks for whom advice or treatment was sought, by source of advice or treatment

Disparities in Care-seeking during Fever

Percentage of children age 0-59 months with fever in the last two weeks for whom advice or treatment was sought at a health facility or provider

Malaria Diagnosis Usage

Percentage of children with fever who had blood taken from a finger or heel for testing

ACT Treatment among Children who Received Treatment

Among children with fever who received anti-malarial treatment, percent treated with Artemisinin-based Combination Therapy (ACT)
Symptoms of Acute Respiratory Infection (ARI)

Care-seeking for Symptoms of ARI

</table>

Percentage of children age 0-59 months with symptoms of ARI in the last two weeks for whom advice or treatment was sought, by source of advice or treatment

Disparities in Care-seeking for Symptoms of ARI

Key Messages

- Of children 0-59 months who had either diarrhea or fever in the past two weeks, over half sought advice or treatment from a health facility or provider, nearly always a public health facility.
- Care seeking behaviour for diarrhea generally decreases with increases in level of education of the mother (61% for care givers with lower secondary and 42% for care givers with higher education).
- Forty-one percent of children with diarrhea in the last 2 weeks were treated with ORS, and one in every five with ORS and Zinc.
- Care seeking behaviour for fever increased with increase in level of education of the mother (73% for care givers with upper secondary and 52% with pre-primary or no education).
- Of children age 0-59 months who had symptoms of ARI, 71% sought advice or treatment from a health facility or provider.

Child Marriage

Child Marriage: Levels & Disaggregates

Marriage before Age 15 & Age 18 among women (SDG 5.3.1*) and men

<table>
<thead>
<tr>
<th></th>
<th>Men age 20-24 years</th>
<th>Women age 20-24 years</th>
</tr>
</thead>
<tbody>
<tr>
<td>Marriage before age 15</td>
<td>2%</td>
<td>8%</td>
</tr>
<tr>
<td>Marriage before age 18</td>
<td>7%</td>
<td>38%</td>
</tr>
</tbody>
</table>

Percentage of women and men age 20-24 years who were first married or in union before age 15 and before age 18

The above chart refers to women and men aged 20 to 24 years, as this youngest cohort most recently completed exposure to the risk of marrying in childhood, thus giving a closer approximation of the current prevalence of child marriage. The following charts, which show disaggregation by background characteristics, refer to the full cohort of women aged 20 to 49 years.

* SDG indicator 5.3.1 refers only to child marriage prevalence among girls: “Proportion of women aged 20-24 years who were married or in a union before age 15 and before age 18”

Disaggregates in Marriage before Age 18 among women

Percentage of women age 20-49 years who were first married or in union before age 18, by residence, education and household wealth quintile

Key Messages

- About 1 in 3 (38%) women age 20-24 were first married or in union before age 18. Child marriage is less common among boys, 7% of young men age 20-24 were married before age 18.
- Rural urban disparities exist in Malawi. Almost half (46%) of women age 20-24 got married before age 18 in rural areas compared to (32%) in urban areas.
- Education and socio-economic status are key determinants of child marriage. Women age 20-49 years with pre-primary or no education were 10 times more likely to get married by age 18 compared to those with higher education. 48% of women in poor households got married by age 18 compared to those from rich households (30%).
- Child marriage is common throughout the country, with at least 4 in 10 young women married in childhood in all regions.
- The percentage of women age 20-49 years who were first married or in union before age 15 and before age 18 has remained generally constant across all age cohorts over time (ranging between 8% and 13% for before age 15 and between 38% and 47% for before age 18.)
Marriage before the age of 18 is a reality for many young girls. In many parts of the world, parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage is a violation of human rights, compromising the development of girls and often resulting in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty. The right to ‘free and full’ consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be ‘free and full’ when one of the parties involved is not sufficiently mature to make an informed decision about a life partner.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
**Key Messages**

- Neonatal Mortality Rate was 26 deaths per 1,000 live births for the 5 years preceding the survey.
- Infant Mortality Rate was 40 deaths per 1,000 live births for the 5 years preceding the survey. The under-5 mortality rate was 56.
- Notably, Under-5 mortality rate was highest among the poorest and second wealth quintile (62 deaths per 1,000 live children) compared to the richest quintile (39 deaths per 1,000 live children).
- Under-5 mortality rate was highest in children whose caregivers had primary education (61 deaths per 1,000 live deaths) compared to those with upper secondary education (34 deaths per 1,000 live children).
- Under-5 mortality rate ranged from 39 deaths per 1,000 live births in Northern Region to 59 deaths per 1,000 live births in Southern Region, for the 5 years preceding the survey.
- Under-5 mortality rate was highest among women in rural areas (58 deaths per 1,000 live births) compared to 42 deaths per 1,000 live births in urban areas.

Neonatal mortality (NN): probability of dying within the first month of life.

Post-neonatal mortality: calculated as the difference between infant and neonatal mortality rates.

Infant mortality (I<sub>4</sub>): probability of dying between birth and first birthday.

Child mortality (I<sub>5</sub>): probability of dying between the first and fifth birthday.

Under-5 mortality (I<sub>5</sub>): probability of dying between birth and fifth birthday.

MICS uses a direct method for estimation of child mortality. This involves collecting full birth histories whereby women aged 15-49 are asked for the date of birth of each child born alive, whether the child is still alive and, if not, the age at death.

Neonatal mortality and under-5 mortality rates (deaths per 1,000 live births) for the five-year period preceding the survey, by region.

**Trends in under-5 mortality rates**

- **MPHC 2018**
- **MIS 2017**
- **MDHS 2015-2016**
- **MES 2014**
- **MICS 2019-20**
- **UNIGME 2020**

The source data used in the above graph is taken from the final reports of MICS 2019-20. Data from UNIGME 2020, MPHC 2018, MDHS 2015-16, MIS 2017 and MES 2014 was downloaded from the UN IGME web portal.

Child mortality source data are published on [www.childmortality.org](http://www.childmortality.org), the web portal of the United Nations Inter-agency Group for Child Mortality Estimation (UN IGME). UN IGME data points may differ from the published estimates of a survey, census or vital registration system since UN IGME recalculates estimates using smaller intervals, longer reference periods and/or calendar years (if data are available).

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Country MICS 2018 related to Child Mortality. Data from this snapshot can be found in tables CS.1, CS.2, and CS.3 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
**Key Messages**

- Only 19% of children aged 7-14 years have foundational reading skills in either Chichewa or English. This means that they are able to correctly read a short story of class 2/3 level and answer five comprehension questions related to the story.
- While 14% of children attending class 2/3 were able to read a short story at that class level, 11% were able to correctly answer literal comprehension questions related to the story, and 9% were able to correctly answer inferential comprehension questions related to the story.
- Thirteen percent of the children aged 7-14 have foundational numeracy skills, which means that they could correctly perform all four listed numeracy tasks. The main issue was on pattern recognition and completion in which about 1 in every 4 children were able to respond correctly.
- For 74% of the children, an adult household member in the last year received a report card for the child. For 32% of the children, an adult household member met with teachers to discuss the child’s progress, 47% attended meeting called by governing body and 43% attended meetings to discuss education and financial issues.
**Foundational Reading Skills, by class of attendance**

Percentage of children age 7-14 years attending primary or lower secondary school by foundational reading skills, by class of attendance.

Note that the chart excludes children out of school or attending higher levels of education.

The percentage of children without foundational reading skills is calculated by subtracting the children with foundational reading skills from the total number of children.

*Not assessed* series have been dropped because all children attending Standard 1-8 and Form 1 have been assessed in English or Chichewa.

**Foundational Numeracy Skills, by class of attendance**

Percentage of children age 7-14 years attending primary or lower secondary school by foundational numeracy skills, by class of attendance.

Note that the chart excludes children out of school or attending higher level of education.

The percentage of children without foundational numeracy skills is calculated by subtracting the children with foundational reading skills from the total number of children.

**Foundational Reading Skills, by age**

Percentage of children age 7-14 years by foundational reading skills, by age at beginning of school year**

The percentage of children without the foundational reading skills is calculated by subtracting the children with foundational reading skills from the total number of children.

- **The reading tasks were available in English and Chichewa. Children were assessed in the main language used by teachers.
- **As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years). Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

**Foundational Numeracy Skills, by age**

Percentage of children age 7-14 years by foundational numeracy skills, by age at beginning of school year*

The percentage of children without foundational numeracy skills is calculated by subtracting children with foundational reading skills from the total number of children.

* As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years). Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.
The Foundational Learning Skills (FL) module is part of the Questionnaire. The reading assessment in the FL module consists of a reading passage and a set of comprehension questions related to the story. The assessment is customised in each country to ensure vocabulary and cultural references are relevant and appropriate. The numeracy assessment consists of four number tasks based on universal math skills expected at 2nd class level.

The reading assessment of Malawi MICS 2019-20 was conducted in English, and Chichewa. As MICS also collects data on school attendance and numerous individual and household characteristics, such as location, household socio-economic status, and ethnicity, the most marginalized sub-populations of children can be identified for support to improve learning outcomes.
**Parental Involvement: Learning Environment at Home**

Percentage of children age 7-14 years attending school, by indicators of parental support

---

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF). UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Early class Learning & Parental Involvement. Data from this snapshot can be found in table LN.3.1, LN.3.3, LN.4.1 and LN.4.2 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Support for Learning

Early Stimulation & Responsive Care

Early childhood, which spans the period up to 8 years of age, is critical for cognitive, social, emotional and physical development. During these years, a child’s newly developing brain is highly plastic and responsive to change. Optimal early childhood development requires a stimulating and nurturing environment, access to books and learning materials, interactions with responsive and attentive caregivers, adequate nutrients, access to good quality early childhood education, and safety and protection. All these aspects of the environment contribute to developmental outcomes for children.

Children facing a broad range of risk factors including poverty; poor health; high levels of family and environmental stress and exposure to violence, abuse, neglect and exploitation; and inadequate care and learning opportunities face inequalities and may fail to reach their developmental potential. Investing in the early years is one of the most critical and cost-effective ways countries can reduce gaps that often place children with low social and economic status at a disadvantage.

Support for learning was very low from both fathers (2%) and mothers (12%).

Attendance at early childhood education programmes was low (34%). Attendance to ECE was much more likely among children living in urban areas (51%) than rural (31%) and high from the richest (51%) than the poorest households (21%).

Only 1% of children had access to three or more children’s books.

Almost half of children age under 5 years were left at home with inadequate supervision in the previous week (44%).

Fifty nine percent of children age 3-4 years were developmentally on track in at least three of the four domains (physical (89%), social-emotional (78%), and learning domains (74%), literacy-numeracy (17%)).

Only 17% of children age 3-4 years were developmentally on track in literacy-numeracy.

Key Messages

- Support for learning was very low from both fathers (2%) and mothers (12%).
- Attendance at early childhood education programmes was low (34%). Attendance to ECE was much more likely among children living in urban areas (51%) than rural (31%) and high from the richest (51%) than the poorest households (21%).
- Only 1% of children had access to three or more children’s books.

ECDI by various characteristics

Note: Data for children whose mother has no education are based on 25-49 unweighted cases.

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Development, and UNICEF, the United States Agency for International Development. Malawi MICS 2019 was carried out in 2019. Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.

Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Early Childhood Development (ECD). Data tables TC.10.1, LN.1.1, TC.10.2, TC.10.3 and TC.11.1 in the Survey Findings Report.
Malawi MICS Snapshots of Key Findings

Education

**Attendance Rates & Inequalities**

**School Net Attendance Rates (adjusted)**

- Early Childhood Education (36-59 months): 34%
- 1 year before the official primary entry age: 72%
- Primary: 93%
- Lower secondary: 12%
- Upper secondary: 10%

Percentage of children of intended age for level of education attending level of education for age or higher, by level of education.

**Inequalities in Attendance in Early Childhood Education & Participation in Organized Learning**

**Early Childhood Education Attendance Rate (age 3-4)**

- Female, 37%
- Male, 31%
- Urban, 51%
- Rural, 31%
- Poorest, 21%

Percentage of children age 36-59 months who are attending early childhood education.

**Participation Rate in Organised Learning (1 Year Before the Official Primary Entry Age): SDG 4.2.2**

- Female, 75%
- Male, 69%
- Urban, 79%
- Rural, 71%
- Poorest, 64%

Percentage of children age one year younger than the official primary school entry age at the beginning of the school year who are attending an early childhood education programme or primary school (adjusted net attendance rate).
### Inequalities in Attendance Rates

#### Primary School Net Attendance Rate (adjusted)

- **Malawi**
  - Female: 94%
  - Male: 92%
  - Urban: 97%
  - Rural: 93%
  - Richest: 97%
  - Poorest: 88%

#### Lower Secondary School Net Attendance Rate (adjusted)

- **Malawi**
  - Female: 14%
  - Male: 10%
  - Urban: 28%
  - Rural: 9%
  - Richest: 30%
  - Poorest: 2%

#### Upper Secondary School Net Attendance Rate (adjusted)

- **Malawi**
  - Female: 12%
  - Male: 8%
  - Urban: 26%
  - Rural: 6%
  - Richest: 27%
  - Poorest: 1%

**Percentage of children of primary school age (as of the beginning of school year) who are attending primary, lower or upper secondary school**

**Percentage of children of lower secondary school age (as of the beginning of school year) who are attending lower secondary school or higher**

**Percentage of children of upper secondary school age (as of the beginning of school year) who are attending upper secondary school or higher**

Malawi MICS Snapshots of Key Findings

**Out of School Rates**

**Out of School Dimensions for Levels of Education**

- **Dimension 1:** Children age one year younger than primary entry age not attending an early childhood education programme or primary school
- **Dimension 2:** Children of primary school age who are not attending any level of education
- **Dimension 3:** Children of lower secondary school age who are not attending any level of education
- **Dimension 4:** Children who are in primary school but at risk of dropping out (over-age for grade by 2 or more years)
- **Dimension 5:** Children who are in lower secondary school but at risk of dropping out (over-age for grade by 2 or more years)

**Key Messages**

- Nationally, attendance to Early Childhood Programme (ECE) Education is at 34%. Attendance is highest among; females (37%) as compared to males (31%), urban (51%) as compared to rural (31%), richest (55%) as compared to poorest (21%)
- Attendance to pre-primary school (1 year prior to primary school entry age) was 72%
- 46% of children at primary school age attend primary school or a higher level. On regional level, northern region has the highest primary school adjusted net attendance rate (92%) followed by southern region (90%) and central region having the lowest net attendance (92%)
- Boys of primary school age have higher risk to be out of school (7%) than girls (5%)
- Completion rate for primary is 53%. Girls (56%), children living in urban area (59%) and richest households (65%) have a higher chance of completing primary school than males (29%), children in rural area (27%) and children in poorest households (13%)
- 12% of children of lower secondary school age attend lower secondary school or a higher level. Lower secondary school adjusted net attendance rate is highest among girls (14%) than boys (10%), in urban (28%) than rural area (9%)
- Lower secondary school completion rate is low (23%), especially for children living in poorest households (9%)
- Only 10% of children of upper secondary school age attend upper secondary school or a higher level
- Girls of upper secondary school age have higher risk to be out of school (37%) compared to boys (31%)
- Upper secondary completion rate is very low (4%), especially for poorest households (less than 1%) for children living in households in the first three quintiles

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF). UNICEF and , the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development (USAID) provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Education. Data from this snapshot can be found in table LN.1.1, LN.1.2, LN.2.3, LN.2.4, LN.2.5, LN.2.6, and LN.2.7 in the Survey Findings Report. Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
**Age Specific Fertility Rates**

Age-specific fertility rates (ASFR) are the number of live births in the last 3 years, divided by the average number of women in that age group during the same period, expressed per 1,000 women.

**Total Fertility Rate**

The total fertility rate (TFR) is calculated by summing the age-specific fertility rates (ASFRs) calculated for each of the five-year age groups of women, from age 15 through to age 49.

**Adolescent Birth Rate: SDG Indicator 3.7.2**

Adolescent Birth rate SDG 3.7.2 indicator is under target 3.7: By 2030, ensure universal access to sexual and reproductive health-care services, including for family planning, information and education, and the integration of reproductive health into national strategies and programmes. Reducing adolescent fertility and addressing the multiple factors underlying it are essential for improving sexual and reproductive health and the social and economic well-being of adolescents. Preventing births very early in a woman’s life is an important measure to improve maternal health and reduce infant mortality.

*Modern Methods include female sterilization, male sterilization, IUD, injectables, implants, pills, male condom, Female condom, diaphragm, foam, jelly and LAM. Traditional methods refer to periodic abstinence and withdrawal

Malawi MICS Snapshots of Key Findings
The proportion of demand for family planning satisfied with modern methods (SDG indicator 3.7.1) is useful in assessing overall levels of coverage for family planning programmes and services. Access to and use of an effective means to prevent pregnancy helps enable women and their partners to exercise their rights to decide freely and responsibly the number and spacing of their children and to have the information, education and means to do so. Meeting demand for family planning with modern methods also contributes to maternal and child health by preventing unintended pregnancies and closely spaced pregnancies, which are at higher risk for poor obstetrical outcomes.

*Percentage of women age 20-24 years who have had a live birth before age 15

### Key Messages

- The Total Fertility Rate (TFR) per woman age 15-49 years is 4.2
- TFR is high in the Southern Region (4.4)
- TFR was highest among women with pre-primary or no education (5.1) and lowest among women with higher education
- TFR was highest among women in the Poorest quintile (5.4) and lowest among women in the Richest quintile (2.9)
- Adolescent Birth Rate ranged from 119 births per 1,000 women in Northern region to 139 births per 1,000 women in Southern region
- Twenty nine percent of women age 20-24 years had a live birth before age 18
- Age Specific Fertility Rate (ASFR) peaks at age 20-24 years for women in both rural and urban
- Adolescent Birth Rate was 5 times higher in women with None/Pre-primary than those with upper secondary education, and over 3 times higher in women from the poorest than those from the richest households

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Fertility and Family Planning. Data from this snapshot can be found in tables TM.1.1, TM.2.1, TM.2.2W, TM.2.3W, TM.3.1 and TM.3.3 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
HIV Indicators

Knowledge
Percent who know of the two ways of HIV prevention (having only one faithful uninfected partner and using a condom every time), who know that a healthy looking person can be HIV-positive, and who reject the two most common misconceptions:

- Women
  - Age 15-24: 39%
  - Age 15-49: 41%

- Men
  - Age 15-24: 44%
  - Age 15-49: 47%

Stigma
Percent of those who report discriminatory attitudes towards people living with HIV, including 1) would not buy fresh vegetables from a shopkeeper or vendor who is HIV-positive and 2) think children living with HIV should not be allowed to attend school with children who do not have HIV:

- Women
  - Age 15-24: 22%
  - Age 15-49: 23%

- Men
  - Age 15-24: 15%
  - Age 15-49: 23%

Testing
Percent who have been tested for HIV in the last 12 months and know the result:

- Women
  - Age 15-24: 51%
  - Age 15-49: 56%

- Men
  - Age 15-24: 38%
  - Age 15-49: 47%

Testing during Antenatal Care
Percent of women who during their antenatal care for their last pregnancy were offered an HIV test, accepted and received results, and received post-test health information or counselling related to HIV:

- Women
  - Age 15-24: 82%
  - Age 15-49: 84%
**HIV Indicators by Key Characteristics**

**Knowledge among Adolescent Girls & Young Women (15-24)**

*Percent age 15-24 who know two ways of HIV prevention, who know that a healthy-looking person can be HIV-positive, and who reject two most common misconceptions.*

**Knowledge among Adolescent Boys & Young Men (15-24)**

*Percent age 15-24 who know two ways of HIV prevention, who know that a healthy-looking person can be HIV-positive, and who reject two most common misconceptions.*

**Tested for HIV in last 12 months**

Percent 15-49 who have been tested for HIV in the last 12 months and know the result, by age group

**Regional Data on HIV Testing**

- **Men who tested in last 12 months**
  - Malawi: 47
  - North: 42
  - Central: 42
  - South: 53

- **Women who tested in last 12 months**
  - Malawi: 56
  - North: 50
  - Central: 53
  - South: 61

- **Women testing at ANC**
  - Malawi: 84
  - North: 88
  - Central: 82
  - South: 86

*Tested in last 12 months: percent age 15-49 who have been tested in the last 12 months and know the result.

HIV testing during ANC: percent of women age 15-49 who during antenatal care for their last pregnancy were offered an HIV test, accepted and received results, and received post-test health information or counselling related to HIV.

Note: Data for Mother's education "Higher" are based on 25-49 unweighted cases.
In many settings, sexual behavior can be considered a risk factor for health and social issues. These include reproductive health, HIV and other sexually transmitted infections, and gender equality and empowerment. An understanding of the population’s sexual behavior patterns can inform both disease prevention and health promotion programmes.

Sexually Active

![Sexual Behaviour by Key Characteristics](chart)

- **Sexually active**: Percent of women and men age 15-24 and 15-49 who had sexual intercourse within the last 12 months.
- **Multiple partners**: Percent of women and men age 15-24 and 15-49 of those who had sex with more than 1 partner in the last 12 months.
- **Condom use**: Percent of women and men age 15-24 and 15-49 who had more than one sexual partner in the last 12 months reporting that a condom was used the last time they had sex.
- **Sex before age 15**: Percent of women and men age 15-24 who had sex before age 15.
- **Sex with man 10 years or older**: Percent of adolescent girls age 15-19 who had sex in the last 12 months who report having had sex with a man 10 or more years older in the last 12 months.

**Key Messages**

- A higher proportion of discriminatory attitudes towards people living with HIV was reported amongst the age groups of 15-24 years: among men (22%) and among women (28%).
- Eighty four percent of women were tested for HIV and received post testing counselling during ANC.
- In the age group 15–24 years, the proportion of sexually active women was 60% and that of men was 51%.
- The proportion of individuals 15-49 years of age tested for HIV in the 12 months preceding the survey and knew their results was 56% among women and 47% among men.
- The pattern was similar among the 15-24 years of age with women being 51% and men at 38%.
- Condom use among men is lower in the age group 15-49 (39%) compared to age group 15-24 (66%).
Sexual Behavior by Key Characteristics

Condom Use among Young People

Adolescent boys 15-19
- 80%

Adolescent girls 15-19
- 34%

Young men 20-24
- 56%

Young women 20-24
- 35%

Percent of adolescents and young people age 15-24 who had more than one sexual partner in the last 12 months reporting that a condom was used the last time they had sex

Sex before Age 15 among Adolescent Girls & Young Women 15-24

Percent of adolescent girls and young women age 15-24 who had sex before age 15

Regional Data on Sexual Behaviour

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development, provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to HIV & Sexual Behaviour. Data from this snapshot can be found in tables

Condom use among Young People

Adolescent boys and young men age 15-24
- Urban, 79%
- Rural, 63%
- Upper secondary, 75%

Adolescent girls and young women age 15-24
- Urban, 54%
- Rural, 31%
- Higher, 62%

Percent of adolescents and young people age 15-24 who had more than one sexual partner in the last 12 months reporting that a condom was used the last time they had sex

Data for area “Urban” are based on 25,49 unweighted cases)

Sex before 15: percent of adolescents and young people age 15-24 who had sexual intercourse before age 15

Condom use: percent of adolescents and young people age 15-24 who had more than one sexual partner in the last 12 months reporting that a condom was used the last time they had sex

(1) Based on 25-49 unweighted cases

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Gender equality means that girls and boys, women and men, enjoy the same rights, resources, opportunities and protections. Investments in gender equality contribute to lifelong positive outcomes for children and their communities and have considerable inter-generational payoffs because children’s rights and well-being often depend on women’s rights and well-being. This snapshot shows key dimensions of gender equality during the lifecycle. It is organized around: 1) the first decade of life (0-9 years of age) when gender disparities are often small, particularly in early childhood; 2) the second decade of childhood (10-19 years of age) when gender disparities become more pronounced with the onset of puberty and the consolidation of gender norms; and 3) adulthood, when gender disparities impacts both the wellbeing of women and girls and boys.

Every Girl & Boy Survives & Thrives: The First Decade of Life

Nutrition and a supportive environment in early childhood are among the key determinants of the health and survival of children and their physical and cognitive development. Generally, girls tend to have better biological endowments than boys for survival to age five, and thus higher survival chances under natural circumstances. However, gender discrimination against girls can affect survival, resulting in higher-than-expected female mortality. Similarly, stunting rates are typically lower among girls than boys, potentially due to the higher risk for preterm birth among boys, which is inextricably linked with lower birth weight. However, children with mothers who gave birth at a young age or who have no education may be more likely to be malnourished. Children with restricted cognitive development during early life are at risk for later neuropsychological problems, poor school achievement, early school drop-out, low-skilled employment, and poor care of their own children. Stimulation and interaction with parents and caregivers can jumpstart brain development and promote well-being in early childhood. This is also the period of development when gender socialization, or the process of learning cultural roles according to one’s sex, manifests. Caregivers, particularly fathers, may respond to, and interact with, sons and daughters differently.

Mortality Rates among Children Under-5, SDG 3.2.1. Sex Disaggregate

Stunting refers to a child too short for his or her age

Wasting refers to a child who is too thin for his or her height

Malnutrition: Wasting (Moderate & Severe) among Children Under-5, SDG 2.2.2

Malnutrition: Stunting (Moderate & Severe) among Children Under-5, SDG 2.2.1

Malnutrition: Overweight (Moderate & Severe) among Children Under-5, SDG 2.2.2
Every Girl & Boy Survives & Thrives: The First Decade of Life

Percentage of children age 2-4 years with whom adult household members engaged in activities that promote learning and school readiness during the last three days, by person interacting with child and sex of child.

Note: Activities include: reading books to the child; telling stories to the child; singing songs to the child; taking the child outside the home; playing with the child; and naming, counting or drawing things with the child

Every Girl & Boy is Protected from Violence & Exploitation: The First Decade of Life

Registering children at birth is the first step in securing their recognition before the law, safeguarding their rights, and ensuring that any violation of these rights does not go unnoticed. While vitally important for both girls and boys, the implications of low birth registration rates for girls are significant, rendering them more vulnerable to certain forms of exploitation they are at greater risk of, including child marriage and international trafficking. Although average birth registration rates are similar for girls and boys, children with mothers who have no education may be less likely to have their births registered. While girls and boys face similar risks of experiencing violent discipline—which includes physical punishment and psychological aggression—by caregivers in the home, gender inequality and domestic violence are among the factors associated with an elevated risk of violence against both girls and boys.

Birth Registration, SDG 16.9.1 Sex Disaggregate

Violent Discipline, SDG 16.2.1 Sex Disaggregate

Percentage of children under age 5 whose births are registered, by sex and maternal education level.

Percentage of children age 1-14 years who experienced violent discipline in the past month, by sex

Note: The age group 1-14 spans the first and second decades of life.
Every Girl & Boy Learns: The First Decade of Life

Investment in good quality early childhood education services prior to entering school improves learning outcomes for children. It also enhances the efficiency of the school system by reducing repetition and drop-out and improving achievement, especially among girls and marginalized groups. Primary education provides the foundation for a lifetime of learning. Considerable progress has been made in achieving universal primary education and closing the gender gap but gender disparities to the disadvantage of girls still exist in some countries. Further, girls still comprise the majority of the world’s out-of-school population. Note: Because children of primary school age range from 6-13 years, these indicators include some children in their second decade of life.

**Participation Rate In Organized Learning, SDG 4.2.2**

![Chart showing participation rate in organized learning by sex](chart1.png)

Percentage of children age one year younger than the official primary school entry age at the beginning of the school year who are attending an early childhood education programme or primary school (adjusted net attendance rate), by sex.

**Primary School Attendance**

![Chart showing primary school attendance by urban/rural and wealth quintile](chart2.png)

Percentage of children of primary school age attending primary, lower or upper secondary school (adjusted net attendance rate), by wealth quintile and urban/rural residence.

**Children of Primary School Age Out of School**

![Chart showing children of primary school age out of school](chart3.png)

Percentage of children of primary school age who are not attending any level of education, by wealth quintile and area.

**Primary Completion, SDG 4.1.2**

![Chart showing primary completion](chart4.png)

Percentage of children age 3 to 5 years above the intended age for the last grade of primary school who have completed primary education, by sex.

**Key Messages**

- Boys have a higher probability of dying before their fifth birthday than girls (62 deaths per 1,000 live births compared to 50).
- Stunting was higher in boys (39%) than girls (32%); in children of mothers with None/Pre-primary education (42%) compared to mothers with higher education (16%).
- Fathers were more than four times less likely to be engaged in activities that promote early stimulation and responsive care activities than mothers.
- For age 3-4 years, 62% of girls were developmentally on track compared to 56% of boys.
- Two in three children under age 5 had their births registered. Birth registration increased with mother’s level of education.
- Four children in five are subjected to some form of violent discipline.
- Primary completion for girls was higher (38%) in comparison to that of boys (29%).
While adolescence carries new health risks for both girls and boys, girls often face gender-specific vulnerabilities, with lifelong consequences. Complications related to pregnancy and childbirth are among the leading causes of death worldwide for adolescent girls age 15 to 19. Preventing adolescent pregnancy not only improves the health of adolescent girls, but also provides them with opportunities to continue their education, preparing them for jobs and livelihoods, increasing their self-esteem and giving them more say in decisions that affect their lives. Yet, too often, adolescent girls lack access to appropriate sexual and reproductive health services, including modern methods of contraception. Additionally, despite having a higher risk of contracting HIV due to both greater physiological vulnerabilities and gender inequalities, adolescent girls are often less knowledgeable than adolescent boys about how HIV is transmitted. However, gender norms adversely impact adolescent boys as well. For example, norms around masculinity that encourage risk-taking may heighten adolescent boys’ use of alcohol and tobacco, increasing their likelihood of developing noncommunicable diseases later in life.

### Contraceptive Use & Demand Satisfied

![Bar chart showing contraceptive use and demand satisfied by modern methods among adolescent girls age 15-19, by marital status.]

Contraceptive use and demand for family planning satisfied by modern methods among adolescent girls age 15-19, by marital status.

### Early Childbearing - by Age 18

![Bar chart showing percentage of women age 20-24 years who had a live birth by age 18, by urban/rural residence.]

Percentage of women age 20-24 years who had a live birth by age 18, by urban/rural residence.

### Comprehensive Knowledge of HIV

![Bar chart showing comprehensive knowledge of HIV among adolescents age 15-19.]

Percent of girls and boys age 15-19 who know of the two ways of HIV prevention (having only one faithful uninfected partner and using a condom every time), who know that a healthy looking person can be HIV-positive, and who reject the two most common misconceptions, and any other local misconception.

### Tobacco* & Alcohol Use

![Bar chart showing tobacco and alcohol use among adolescents age 15-19, by sex.]

Tobacco and alcohol use among adolescents age 15-19, by sex.

*Includes an age and sex disaggregate of SDG 3.a.1: use of tobacco
Adolescence presents unique vulnerabilities to violence and exploitation for girls. In many countries, marriage before the age of 18 is a reality for girls due to the interaction of several factors that place a girl at risk, including poverty, social norms, customary or religious laws that condone the practice, an inadequate legislative framework and the state of a country’s civil registration system. Child marriage often compromises a girl’s development by resulting in early pregnancy and social isolation, interrupting her schooling, and limiting her opportunities for career and vocational advancement. It also often involves a substantial age difference between the girl and her partner, thus further disempowering her and putting her at greater risk of partner violence, sexually transmitted diseases and lack of agency. Attitudes about wife beating serve as a marker for the social acceptability of intimate partner violence. Acceptance of wife beating among adolescent girls and boys suggests that it can be difficult for married girls who experience violence to seek assistance and for unmarried girls to identify and negotiate healthy and equitable relationships. Female genital mutilation is a human rights issue that also affects girls and women. Adolescence, in particular, is a vulnerable period for girls who have undergone FGM because they may experience heightened consequences of the procedure as they become sexually active and begin childbearing. Gender-based discrimination may be one of the most ubiquitous forms of discrimination adolescent girls face, and it has long-lasting and far-reaching effects on their personal trajectories as well as on all aspects of social and economic development. While in most regions, girls and boys are equally likely to be involved in child labour, gender is a determinant of the types of activities boys and girls engage in, with girls more likely to be involved in domestic work.

**Child Marriage, SDG 5.3.1**

Percentage of women aged 20-24 years who were first married or in union before age 15 and before age 18*, by area and wealth quintile

**Spousal Age Difference**

Percent distribution of adolescent girls age 15-19 currently married or in union by age of their partner, by education level and wealth quintile

Data for Mother's education "None/pre primary" are based on 25,499 unweighted cases

**Feelings of Safety, SDG 16.1.4 Age & Sex Disaggregate**

Percentage of adolescents age 15-19 who feel safe walking alone in their neighbourhood after dark, by sex

**Attitudes toward Domestic Violence**

Percentage of adolescents age 15-19 years who justify wife beating for any of the following reasons: she goes out without telling him; she neglects the children; she argues with him; she refuses sex with him; she burns the food, by sex and age group
**Every Adolescent Girl & Boy is Protected from Violence & Exploitation: The Second Decade of Life**

* Note: Indicator includes children in the first & second decade of life

**Every Adolescent Girl & Boy has an Equitable Chance In Life: The Second Decade of Life**

To become empowered, adolescent girls and boys need to be engaged as civic participants in the decisions affecting their lives and communities. People’s sense of security and freedom from the fear of crime influence how they move about those communities, access services and economic opportunities and participate in public life. Adolescent girls and boys are likely to have different perceptions of personal safety due to different gender-based vulnerabilities to sexual violence and other crimes. Life satisfaction measures an individual’s perceived level of well-being or how an individual feels about their life as a whole. Measuring adolescent girls’ and boy’s satisfaction with their lives can provide important insights into their mental health during a stage of life when gender norms consolidate and girls and boys experience different risk factors for mental health disorders.

**Discrimination & Harassment**

Percentage of adolescent girls and boys age 15-19 years who have ever felt discriminated or harassed based on their gender

**Life Satisfaction**

Among adolescents age 15-19, average life satisfaction score on a scale of 0 to 10, by sex and age group
Globally, participation in secondary education is expanding, progress lags behind primary education. Gender disparities disadvantaging girls are also wider and occur in more countries at the secondary level than at the primary level. Yet, advancing girls’ secondary education is one of the most transformative development strategies countries can invest in. Completion of secondary education brings significant positive benefits to girls and societies – from increased lifetime earnings and national growth rates, to reductions in child marriage, stunting, and child and maternal mortality.

Percentage of children of lower secondary school age attending lower secondary school or higher (adjusted net attendance rate), by sex, wealth quintile and area

Percentage of children of upper secondary school age attending upper secondary school or higher (adjusted net attendance rate), by sex, wealth quintile and area

Percentage of children who age 3 to 5 years above the intended age for the last grade of lower secondary school who have completed lower secondary education, by sex

Percentage of children or youth who age 3 to 5 years above the intended age for the last grade of upper secondary school who have completed upper secondary education, by sex
Every Adolescent Girl & Boy Learns: The Second Decade of Life

Children of Lower Secondary School Age Out of School

- Percentage of children of lower secondary school age who are not attending any level of education, by wealth quintile and area.

Every Adolescent Girl & Boy Lives In a Safe & Clean Environment: The Second Decade of Life

Menstrual Hygiene Management

- The ability of adolescent girls to safely manage their monthly menstrual cycle in privacy and with dignity is fundamental to their health, psychosocial well-being and mobility. Girls in low-resource and emergency contexts without access to adequate menstrual hygiene management facilities and supplies experience stigma and social exclusion while also foregoing important educational, social and economic opportunities.

- Menstrual Hygiene Management: Among adolescent girls age 15-19 who reported menstruating in the last 12 months, percentage using appropriate menstrual hygiene materials with a private place to wash and change while at home.

- Exclusion from Activities during Menstruation: Among adolescent girls age 15-19 who reported menstruating in the last 12 months, percentage of women who did not participate in social activities, school or work due to their last menstruation in the last 12 months.

Key Messages

- Twenty nine percent women age 20-24 years had a live birth by age 18 with a higher proportion in rural areas (31%) compared to urban areas (21%).
- Thirty-eight percent of women age 20-24 years were married/ in a union before age 18 with 7% before age 15.
- Women are twice as likely to marry before the age of 18 in rural (41%) than in urban (22%) area; for marriages before the age of 15, it is 8% for rural and 4% for urban.
- Among married adolescent girls aged 15-19 years, 6% have a partner who is at least ten years older.
- Fourteen percent of children age 5-17 years were engaged in child labour.
- Twenty percent of adolescent girls age 15-19 years reported having been excluded from activities (social activities, school or work) due to their last menstruation in the last 12 months.
- Men and boys are more likely to feel safe walking alone in their neighbourhood after dark, as well as when at home alone, as compared to women and girls in the same circumstances.
Gender Equality in Adulthood

To survive and thrive, all children require care and support from women and men. Care and support can be substantively improved by fostering gender equality, an important goal in its own right, and by reducing the gender-related barriers. Gender-related barriers include women’s and girls’ disproportionate lack of information, knowledge and technology, resources, and safety and mobility, as well as the gender division of labour and gender norms. For example, a mother’s lack of mobility, due to prohibitive norms or lack of transportation, may impede birth registration, nutrition, and other child outcomes. The internalization of gender norms around masculine and feminine expectations and behaviours may influence women’s and men’s attitudes toward intimate partner violence and physical punishment of children as well as self-perceptions of well-being, including life satisfaction and expectations for the future.

Gender Equality in Adulthood

Safety & Security

Feeling safe while walking alone, SDG 16.1.4 sex disaggregate

Percentage of adults who feel safe walking alone in their neighbourhood after dark, by sex and area.

Feeling safety while being at home alone

Percentage of adults (age 15-49) who feel safe being home alone after dark, by sex and area.

Victimisation

Percentage of adults age 15-49 who experienced physical violence of robbery or assault in the last year, by sex, wealth quintile and area.

Reporting of victimisation to police, SDG 16.3.1

Percentage of adults age 15-49 for whom the last incident of physical violence of robbery and/or assault in the last year was reported to the police, by sex, wealth quintile and area.

Discrimination & harassment

Percentage of adults age 15-49 who have ever personally felt discriminated or harassed based on their gender, by sex and area.

Key Messages

• Few people ever reported their last incidence of victimization to the police with 20% representing men and 25% women
• On a scale of 0-10, there were no differences between women and men in terms of their perception towards life satisfaction
• Women and girls in both urban and rural areas felt discriminated or harassed compared to their male counterparts
Women (19%) believed that it is justified to wife beating for any of the following reasons: she goes out without telling him; she neglects the children; she argues with him; she refuses sex with him; she burns the food, by sex, wealth quintile and area.

Among adults age 15-49, average life satisfaction score on a scale of 0 to 10, by sex, wealth quintile and marital status. Higher scores indicate higher satisfaction levels.

Percentage of adults age 15-49 who justify wife beating for any of the following reasons: she goes out without telling him; she neglects the children; she argues with him; she refuses sex with him; she burns the food, by sex, wealth quintile and area.

Percentage of adults age 15-49 who expect that their lives will get better in one year, by sex, wealth quintile and marital status.

Key Messages

- More women (19%) believed that it is justified to wife beating for the following reasons; she goes out without telling him; she neglects the children; she argues with him; she refuses sex with him; she burns the food compared to 12% of men.
- On a scale of 0-10, women had a better life satisfaction (5.9) than men (5.4) in terms of their perception towards life.
- More men (73%) age 15-49 years expected their lives to get better in one year following the study than women (65%).

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Early Childhood Development (ECD). Data from this snapshot can be found in tables TC.10.1, PR.5.1, EQ.3.1W, EQ.3.1M, PR.2.1, PR.2.2, PR.5.1, PR.5.3, EQ.3.1W, EQ.3.1M, PR.7.1W, PR.7.1M, EQ.5.1W, EQ.5.1M, SR.9.3W, SR.9.3M, EQ.2.1W, EQ.2.1M, WS.4.1, WS.4.2, WS.1.3 and WS.1.4 in the Survey Findings Report.

Further statistical snapshots and the Summary Findings Report for this and other surveys are available on mics.unicef.org/surveys.
Hygiene service refers to a facility lacking water and/or soap. The proportion of the urban population that used basic hygiene services was 49%.

Malawi MICS Snapshots of Key Findings

Key Messages

- Three in every four of the household population had basic drinking water services: 91% in urban areas and 71% in rural areas.
- Forty six percent of the household population used basic sanitation facilities.
- The proportion of the urban population using limited sanitation services was 49%.
- Twenty eight percent of the population had basic hygiene services: slightly above 1 in 2 urban and 1 in 4 in rural areas.
- Of the households without water on premises, 26% in urban areas, spent over 30 minutes fetching water per day compared to almost half (48%) in the rural areas.
- Over half of the urban population (53%) used shared sanitation facilities and 37 percent in the rural areas.

*Additional information required to determine whether faecal sludge and wastewater is safely treated.

**Safely managed sanitation services** represents an ambitious new level of service during the SDGs and is the indicator for target 6.2. Safely managed sanitation services are improved facilities that are not shared with other households and where excreta are safely disposed of in situ or transported and treated offsite. The MICS survey collected information on the management of excreta from onsite facilities. For households where excreta are transported offsite (sewer connection, removal for treatment), further information is needed on the transport and treatment of excreta to calculate the proportion that are safely managed.

The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Drinking Water, Sanitation & Hygiene (WASH). Data from this snapshot can be found in tables WS.1.1 to WS.4.2 in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.

For further information on the WHO/UNICEF Joint Monitoring Programme (JMP) for Water Supply, Sanitation and Hygiene indicator definitions and methods please visit washdata.org.

- **Women:**
  - Urban: 8%
  - Rural: 6%

Percentage of women & men age 15-49 years who are exposed to specific mass media (newspaper, radio, television) on a weekly basis and percentage of women & men age 15-49 who are exposed to all three on a weekly basis.

Inequalities in Exposure to Mass Media

**Women Exposed to Newspaper, Radio & Television Weekly**

- **Urban, 9%**
- **Vocational, 33%**
- **Rural, 1%**

**Men Exposed to Radio, Newspapers & Television Weekly**

- **Urban, 15%**
- **Vocational, 34%**
- **Rural, 3%**

Percentage of women age 15-49 years who are exposed to newspaper, radio, and television on a weekly basis.

**Key Messages**

- Fifty eight percent households owned a mobile phone; while 31% owned a radio; 11% owned a television set, 4% owned a computer and a mere 1% owned a fixed telephone line.
- Twelve percent of the households had access to internet at home.
- More men (18%) used the internet compared to women (7%).
- Women and men in Malawi had low access to all three forms of mass media (radio, television and newspaper) of mass media, 2% and 5% respectively.
- Eleven percent of men read a newspaper weekly compared to 8% of women. 59% men and 38% women listened to a radio weekly, while 22% men and 15% women watched television weekly.
- Mobile phone usage was high for men (71%) than women (53%). Mobile phone use was high for those with higher education for both men (100%) and women (98%) and lower for those with none or pre-primary education; men (47%), women (31%).
- Men were three times more likely to possess computer skills than women, 7% and 2%, respectively. Internet use was high for those with higher education for both men (82%) and women (77%) and lower for those with none or pre-primary education; men (3%), women (1%).

Percentage of women age 15-49 years who during the last 3 months used a mobile phone

Percentage of men age 15-49 years who during the last 3 months used a mobile phone

Percentage of women age 15-49 years who used the internet in the last 3 months

Percentage of men age 15-49 years who used the internet in the last 3 months
The Malawi Multiple Indicator Cluster Survey (MICS) was carried out in 2019-20 by the National Statistical Office as part of the global MICS programme. Technical support was provided by the United Nations Children’s Fund (UNICEF), UNICEF, the Government of Malawi, the Royal Norwegian Embassy, German Agency for International Cooperation, Global Alliance for Vaccines and Immunizations and the United States Agency for International Development provided financial support.

The objective of this snapshot is to disseminate selected findings from the Malawi MICS 2019-20 related to Mass Media, Communications & Internet. Data from this snapshot can be found in tables SR.9.1W, SR.9.1M, SR.9.2, SR.9.3W, SR.9.3M, SR.9.4W and SR.9.4M in the Survey Findings Report.

Further statistical snapshots and the Survey Findings Report for this and other surveys are available on mics.unicef.org/surveys.
