
Stunting affected an estimated 21.9 per cent or 149 million children under 5 globally in 2018.

In 2018, wasting continued to threaten the lives of an estimated 7.3 per cent or 49 million children under 5 globally.

An estimated 5.9 per cent or 40 million children under 5 around the world were overweight in 2018.

Levels and trends in child malnutrition

UNICEF / WHO / World Bank Group
Joint Child Malnutrition Estimates
Key findings of the 2019 edition

149 million

49 million

40 million
Good nutrition allows children to survive, grow, develop, learn, play, participate and contribute – while malnutrition robs children of their futures and leaves young lives hanging in the balance.

Stunting is the devastating result of poor nutrition in-utero and early childhood. Children suffering from stunting may never attain their full possible height and their brains may never develop to their full cognitive potential. Globally, approximately 149 million children under 5 suffer from stunting. These children begin their lives at a marked disadvantage: they face learning difficulties in school, earn less as adults, and face barriers to participation in their communities.

Wasting in children is the life-threatening result of poor nutrient intake and/or disease. Children suffering from wasting have weakened immunity, are susceptible to long term developmental delays, and face an increased risk of death, particularly when wasting is severe. These children require urgent feeding, treatment and care to survive. In 2018, over 49 million children under 5 were wasted and nearly 17 million were severely wasted.

There is also an emerging face of malnutrition: childhood overweight and obesity. There are now over 40 million overweight children globally, an increase of 10 million since 2000. The emergence of overweight and obesity has been shaped, at least in part, by industry marketing and greater access to processed foods, along with lower levels of physical activity.

While malnutrition can manifest in multiple ways, the path to prevention is virtually identical: adequate maternal nutrition before and during pregnancy and lactation; optimal breastfeeding in the first two years of life; nutritious, diverse and safe foods in early childhood; and a healthy environment, including access to basic health, water, hygiene and sanitation services and opportunities for safe physical activity. These key ingredients can deliver a world where children are free from all forms of malnutrition.

Despite this opportunity, the UNICEF, WHO, World Bank global and regional child malnutrition estimates reveal that we are still far from a world without malnutrition. The joint estimates, published in March 2019, cover indicators of stunting, wasting, severe wasting and overweight among children under 5, and reveal insufficient progress to reach the World Health Assembly targets set for 2025 and the Sustainable Development Goals set for 2030.

Improving children’s nutrition requires effective and sustained multi-sectoral nutrition programming over the long term, and many countries are moving in the right direction. Regular data collection is critical to monitor and analyse country, regional and global progress going forward.

The ultimate aim is for all children to be free of malnutrition in all its forms

Forms of malnutrition* highlighted in this key findings report

**Stunting** refers to a child who is too short for his or her age. These children can suffer severe irreversible physical and cognitive damage that accompanies stunted growth. The devastating effects of stunting can last a lifetime and even affect the next generation.

**Overweight** refers to a child who is too heavy for his or her height. This form of malnutrition results from energy intakes from food and beverages that exceed children’s energy requirements. Overweight increases the risk of diet-related noncommunicable diseases later in life.

**Wasting** refers to a child who is too thin for his or her height. Wasting is the result of recent rapid weight loss or the failure to gain weight. A child who is moderately or severely wasted has an increased risk of death, but treatment is possible.

Some children suffer from more than one form of malnutrition – such as **stunting and overweight** or **stunting and wasting**. There are currently no joint global or regional estimates for these combined conditions.
Malnutrition rates remain alarming: stunting is declining too slowly while wasting still impacts the lives of far too many young children

Africa and Asia bear the greatest share of all forms of malnutrition

In 2018, more than half of all stunted children under 5 lived in Asia and more than one third lived in Africa.

In 2018, more than two thirds of all wasted children under 5 lived in Asia and more than one quarter lived in Africa.

In 2018, almost half of all overweight children under 5 lived in Asia and one quarter lived in Africa.
In 7 sub-regions, at least one in every four children under 5 is stunted
Percentage of stunted children under 5, by United Nations sub-region, 2018

Stunting

**NUMBERS AFFECTED**

Two out of five stunted children in the world live in Southern Asia

Number (millions) of stunted children under 5, by United Nations sub-region, 2018

- **Asia**: 81.7 million
  - Southern Asia: 57.9 million
  - Eastern Asia*: 4.4 million
- **Africa**: 58.8 million
  - Western Africa: 24.0 million
  - Eastern Africa: 14.4 million
  - Middle Africa: 9.4 million
  - Southern Africa: 2.0 million
  - Northern Africa: 0.3 million
- **Latin America and Caribbean**: 4.8 million
  - Central America: 2.1 million
  - Caribbean: 0.2 million
  - South America: 2.5 million
- **Oceania**: 0.5 million

Source: UNICEF, WHO, World Bank Group joint malnutrition estimates, 2019 edition. Note: *Eastern Asia excluding Japan; **Oceania excluding Australia and New Zealand; ***The Northern America sub-regional average based on United States data. There is no estimate available for the More Developed Region or for sub-regions of Europe or Australia and New Zealand due to insufficient population coverage. Aggregates may not add up due to rounding and/or lack of estimates for the More Developed Region.

Africa is the only region where the number of stunted children has risen

Trends in the number (millions) of stunted children under 5, by United Nations region/sub-region, 2000 and 2018

- **Africa**: 50.3 million to 58.8 million
  - Southern Africa: 0.3 million to 2.0 million
  - Eastern Africa: 18.5 million to 24.0 million
  - Western Africa: 9.4 million to 24.0 million
- **Asia**: 134.7 million to 81.7 million
  - South-eastern Asia: 21.5 million to 21.0 million
  - Eastern Asia: 21.5 million to 14.4 million
  - Southern Asia: 58.7 million to 57.9 million
- **Latin America and Caribbean**: 9.6 million to 4.8 million
  - Central America: 4.1 million to 0.3 million
  - South America: 4.9 million to 2.3 million
  - Caribbean: 2.0 million to 0.5 million
  - Oceania: 0.5 million to 0.7 million

Country Income Classification

TRENDS

Upper-middle-income countries reduced their stunting prevalence by two-thirds since 2000

Percentage of stunted, overweight and wasted children under 5, by country income classification, 2000 – 2018

Note: *High-income countries: low (<50 per cent) population coverage in all time periods.

Upper-middle-income countries have the largest relative declines in the number of stunted children of all income groups

Number of stunted children under 5, by country income classification, 2000 and 2018

There has been no progress to stem the rate of overweight in more than 15 years in any country-income group

Number of overweight children under 5, by country income classification, 2000 and 2018

Source: UNICEF, WHO, World Bank Group joint malnutrition estimates, 2019 edition. Note: *High-income countries: low (<50 per cent) population coverage in all time periods. Based on FY19 World Bank income classification. The values for “percentage change since 2000” are based on calculations using unrounded estimates and therefore might not match values calculated using the rounded estimates presented in this brochure.
Country Income Classification

SHARE BY REGION

While only about half of all children under-5 live in lower-middle income countries, two-thirds of all stunted children and three-quarters of all wasted children live there.

### Distribution of children under-5 in the world, by country income grouping, 2018

- **17%** of all under-5 children live in low income countries
- **46%** of all under-5 children live in lower-middle income countries
- **26%** of all under-5 children live in upper-middle income countries
- **10%** of all under-5 children live in high income countries

### Distribution of children under 5 affected by stunting, overweight and wasting in 2018

- **65%** of all stunted children live in lower-middle income countries
- **27%** of all stunted children live in low-income countries
- **8%** of all stunted children live in upper-middle income countries
- **1%** of all stunted children live in high-income countries

- **73%** of all wasted children live in lower-middle income countries
- **17%** of all wasted children live in low-income countries
- **7%** of all wasted children live in upper-middle income countries
- **1%** of all wasted children live in high-income countries

- **36%** of all overweight children live in lower-middle income countries
- **11%** of all overweight children live in low-income countries
- **39%** of all overweight children live in upper-middle income countries
- **15%** of all overweight children live in high-income countries

*Share is relative to the total number affected across the 4 country-income groups; this varies from the official global estimates presented in other parts of the brochure (Stunting official estimate 149.0 million; sum of 4 country-income groups = 149.9 million. Wasting official estimate 49.5 million; sum of country-income groups = 48.3 million. Overweight official estimate 40.1 million; sum of 4 country-income groups = 33.9 million)."

13

Strengths and weaknesses of malnutrition data

Prevalence estimates for stunting and overweight are relatively stable over the course of a calendar year. It is therefore possible to track global and regional changes in these two conditions over time.

Wasting and severe wasting are acute conditions that can change frequently and rapidly over the course of a calendar year. This makes it difficult to generate reliable trends over time with the input data available, and as such, this report provides only most recent global and regional estimates.

The joint global and regional estimates that make up the UNICEF/WHO/World Bank Group Joint Child Malnutrition Estimates have been generated using a country-level dataset which is mainly comprised of estimates from nationally representative household surveys. These data are collected infrequently (every 3 to 5 years in most countries) and measure malnutrition at one point in time (e.g. during one or several months of field work), making it difficult to capture the rapid fluctuations in wasting that can occur over the course of a given year. Incidence data (i.e. the number of new cases that occur during the calendar year) would allow for better tracking of changes over time; however, these data currently do not exist.

The analysis methods and presentation have remained unchanged from the 2012 report, except for minor refinements detailed below:

1. **Year assigned to each survey**

When data collection begins in one calendar year and continues into the next, the survey year assigned is the one in which most of the fieldwork took place. For example, if a survey was conducted between 1 September 2009 and 28 February 2010, the year 2009 would be assigned, since the majority of data collection took place in that year (i.e., four months in 2009 versus two months in 2010). This method has been used since the 2013 edition (prior to that, the latter year was used by default – e.g., 2010 in the example above).

2. **Final reports only**

As of the 2014 edition, the country-level dataset used to generate the global and regional joint malnutrition estimates is based only on final survey results. Preliminary survey results are no longer included in the dataset since the data are sometimes retracted or change significantly when the final version is released.

3. **Updated data sources**
   i. The updated joint dataset includes:
      - 854 nationally representative surveys;
      - data from 152 countries and territories, representing more than 90 per cent of all children under 5 globally (population coverage varies by regions and periods). The majority of data available are from low- and middle-income countries – more efforts are needed to generate data from high-income countries.
   ii. The under 5 population estimates were based on The United Nations World Population Prospects, 2017 Revision. These were used as weighting factors for each country survey to derive the regional and global prevalence estimates and calculate the numbers affected.
   iii. Regional and country income classifications were based on FY19 World Bank income classification.

4. **Footnotes on population coverage**

As started in the 2014 edition, a separate exercise was conducted to assess population coverage. This was important in order to alert the reader, via footnotes, to instances where the data should be interpreted with caution due to low population coverage (defined as less than 50 per cent). A conservative method was applied looking at available data within five-year periods around the projected years. Population coverage was calculated as:

\[
\text{Population coverage} = \frac{\text{the sum of country five-year average populations for which surveys are available in the dataset}}{\text{the total of country five-year average population for all countries in the region}}
\]

Population coverage for the most recent period (2013-2018), by UN regions

Note: * Asia excluding Japan; **Oceania excluding Australia and New Zealand. *** The More Developed Region malnutrition estimates are not displayed in the brochure due to lack of adequate population coverage (<50 per cent) in all year ranges since 1990. Also note that figures for wasting are the same as for stunting and therefore not presented.
5. Prevalence thresholds for wasting, overweight and stunting in children under 5 years

New thresholds, presented in Table 1, were established through the WHO-UNICEF Technical Advisory Group on Nutrition Monitoring (TEAM)\(^2\) and released in 2018. These new thresholds have been used for development of prevalence-based maps in this brochure. The thresholds were developed in relation to standard deviations (SD) of the normative WHO Child Growth Standards. The international definition of ‘normal’ (two SD from the WHO standards median) defines the first threshold, which includes 2.3% of the area under the normalized distribution. Multipliers of this “very low” level (rounded to 2.5%) set the basis to establish subsequent thresholds.

ONLINE MATERIALS

This key findings report of the 2019 edition of the Joint Malnutrition Estimates summarizes the new regional and global numbers and main messages for official United Nations data on child malnutrition.

- the latest country-level joint malnutrition dataset, a time series of all country estimates that were used to generate the joint child malnutrition global and regional estimates;
- the joint malnutrition global and regional estimates database by various regional groupings (e.g. United Nations, UNICEF, WHO, etc., regional groupings) and for more years than presented in this brochure;
- a reference document outlining the composition of the various regional groupings for which the joint estimates have been produced.

- interactive dashboards, which allow users to visualize and export the global and regional estimates for a number of regional groupings.

All of these materials can be downloaded from the links below:

UNICEF: https://data.unicef.org/resources/jme
WHO: www.who.int/nutgrowthdb/estimates
World Bank Group: <data.worldbank.org/child-malnutrition>

DASHBOARD OVERVIEW

Tabs where you can select different visualizations for global and regional data

Options

Select your regional grouping (UNICEF, WHO, United Nations, World Bank Income)
Select regions to view
Select years to view
Hover over data points for detailed information

Download the graphics and data here

With these links you can view the dashboard on the UNICEF, WHO or World Bank Group websites
