

Child and Family Tracker

ROUND 9
April 2022

unicef 
for every child

Tracking impact of COVID: [COVID-19 child and family tracker: Findings](#) | UNICEF Nepal

Suggested citation: United Nations Children's Fund, *Child and Family Tracker (CFT)*, UNICEF, Kathmandu, Nepal, April 2022

INCOME AND JOBS

HH at risk of income poverty still higher than baseline observations in May

70-75% HH (income and/or jobs) were shocked at least 1 time in 6 rounds

TOP 3 NEEDS of HHs

32% Cash/Money

18% Food

14% Employment

82% confident schools will operate safely

50% worried children Have fallen behind

41% reported children with story books

EDUCATION

27% indebted

12% selling assets

7% reduced food for children

8% reported noticing child labour

COPING

13% noticed domestic violence (VAWC)

Children in 14% of households were showing signs of increased anger
29% reported Witnessing early marriage

Top concerns of caregivers:

Too much internet, smoking and drinking, bad company

PROTECTION

24% HH reported difficulty accessing water

WASH

10% with MUAC readings yellow/red

20% struggling for food

29% changed breastfeeding habits

25% reported child had fallen ill/had fever

HEALTH & NUTRITION

HH having a person with disability in the HH face

significantly higher risks having been exposed to job losses, income shocks and were more likely to declare needing food and money and incurring

Dalt Households are more likely to be falling into poverty and declaring food and money as a top 3 need

DISPARITIES

Female headed households are more likely to incur debt and report their children are falling behind in school

10	CFT Round 9	2022-04-02	2022-04-12	10 days

Various rounds of the CFT and daily new confirmed cases COVID-19

Our World
in Data

7-day rolling average. Due to limited testing, the number of confirmed cases is lower than the true number of infections.

Source: Johns Hopkins University CSSE COVID-19 Data

CC BY

Per cent distribution of respondents

SAMPLE AND HOUSEHOLD CHARACTERISTICS CFT 9

Sample size 5,825 (lowest across all rounds)

- **Oversampled** Lumbini and Sudurpaschim purposively
- Respondents speaking on behalf of a total of **32,433 family members** of whom **40% are children**
- Sampled respondents are from **80+% of all municipalities**
- **61% respondents** are female caregivers
- Average age of respondents is **35 years**
- Number of children in the HH: 2 children (42%), 1 child (27%), 3 children (19%), 4 children (7%), 5+ children (4%)
- **Average family size=6**
- **20% of sampled households** are female headed
- **12% HH** have a disabled person living with them
- Sampled during April 02-April 14, 2022

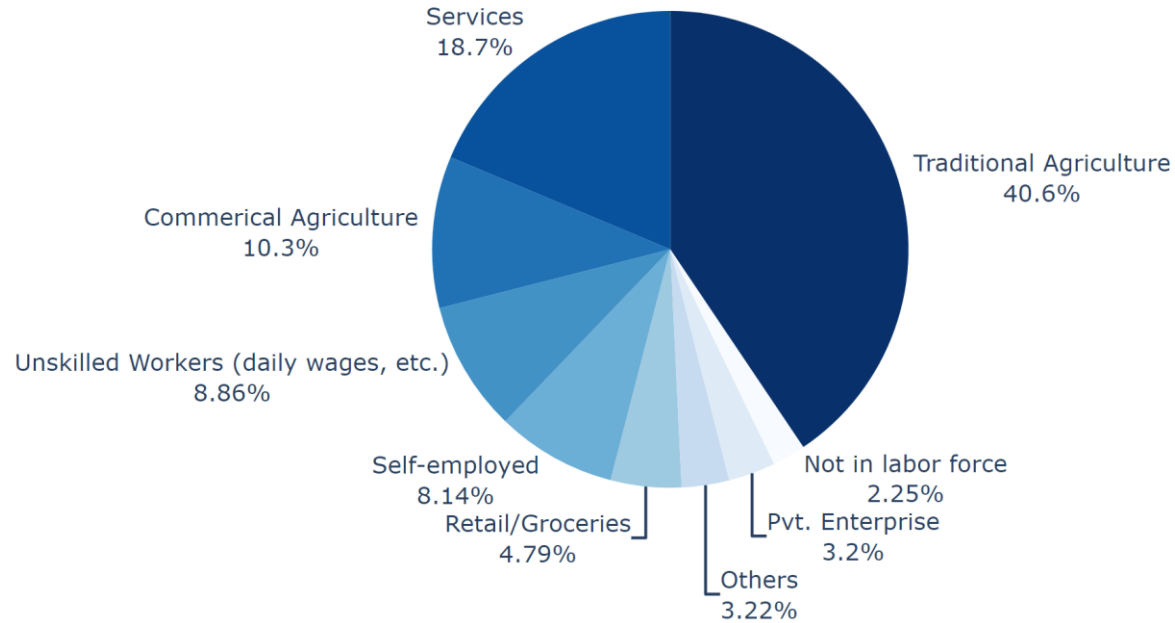

SOCIO-ECONOMIC BACKGROUND

unicef 
for every child

Primary profession (L) and monthly income last month (R)

2.1: What is your primary profession

2.2: Earnings last month (NPR)

Agriculture remains the primary source of employment followed by services, unskilled labour, self employment and retail/groceries.

Round 9 reporting the lowest per cent of households at risk of income poverty since July 2020: 18%

Earnings (NPR/month) by sector of employment

Last month earnings in NPR by sector of employment

Job losses by Province (per cent reporting job or livelihood losses in family)

2.06: What are your families top three needs at present?

Top 3 immediate needs by sector of employment

Lower level of needs overall for those in services
Unskilled labourers and those in the agriculture sector needed maximum financial support

Top 3 immediate needs by income group

Significant difference between top and lower income groups

Top 3 immediate needs by Province

Sudurpaschim appears to be having the highest levels of needs

Top 3 immediate needs by whether respondent reported job/livelihood losses

Those respondents who reported having job/livelihood losses in the family during the last month (top panel) were significantly more likely to be in need of financial assistance, employment, food and children's education.

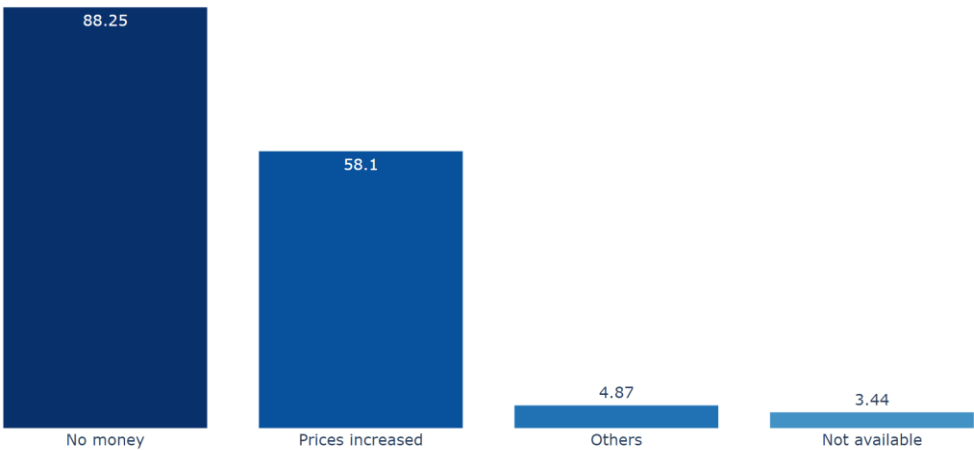

2.7: Has your family been struggling to have enough food everyday this month? By income 2.7: Has you family been struggling to have enough food this month? By Province

Struggling for food daily

2.8: Reasons struggled for food everyday this month

- **Worsened since last** round in contrast to some other key indicators and rose significantly from 17% in Oct/Nov 2021 to 21% in April 2022. However, strong variation in the data:
- Lowest income group **more than 9 times** likely to struggle for food compared to top income group
- Residents from **Sudurpaschim** **twice as likely** to be struggling for food daily
- Respondent's reporting **job losses** **twice as likely** to be struggling for food
- Struggle for food is linked to **lack of money and rising prices**

2.9: Financial coping mechanisms at present (Per cent responding yes)

2.09: Financial coping mechanisms at present, by income

Graph depicts the percent responding yes to each type of coping mechanism by income group. As expected upper income households are able to rely on their salaries to a larger extent. They are also able to rely more on government support and remittances compared to lower income groups.

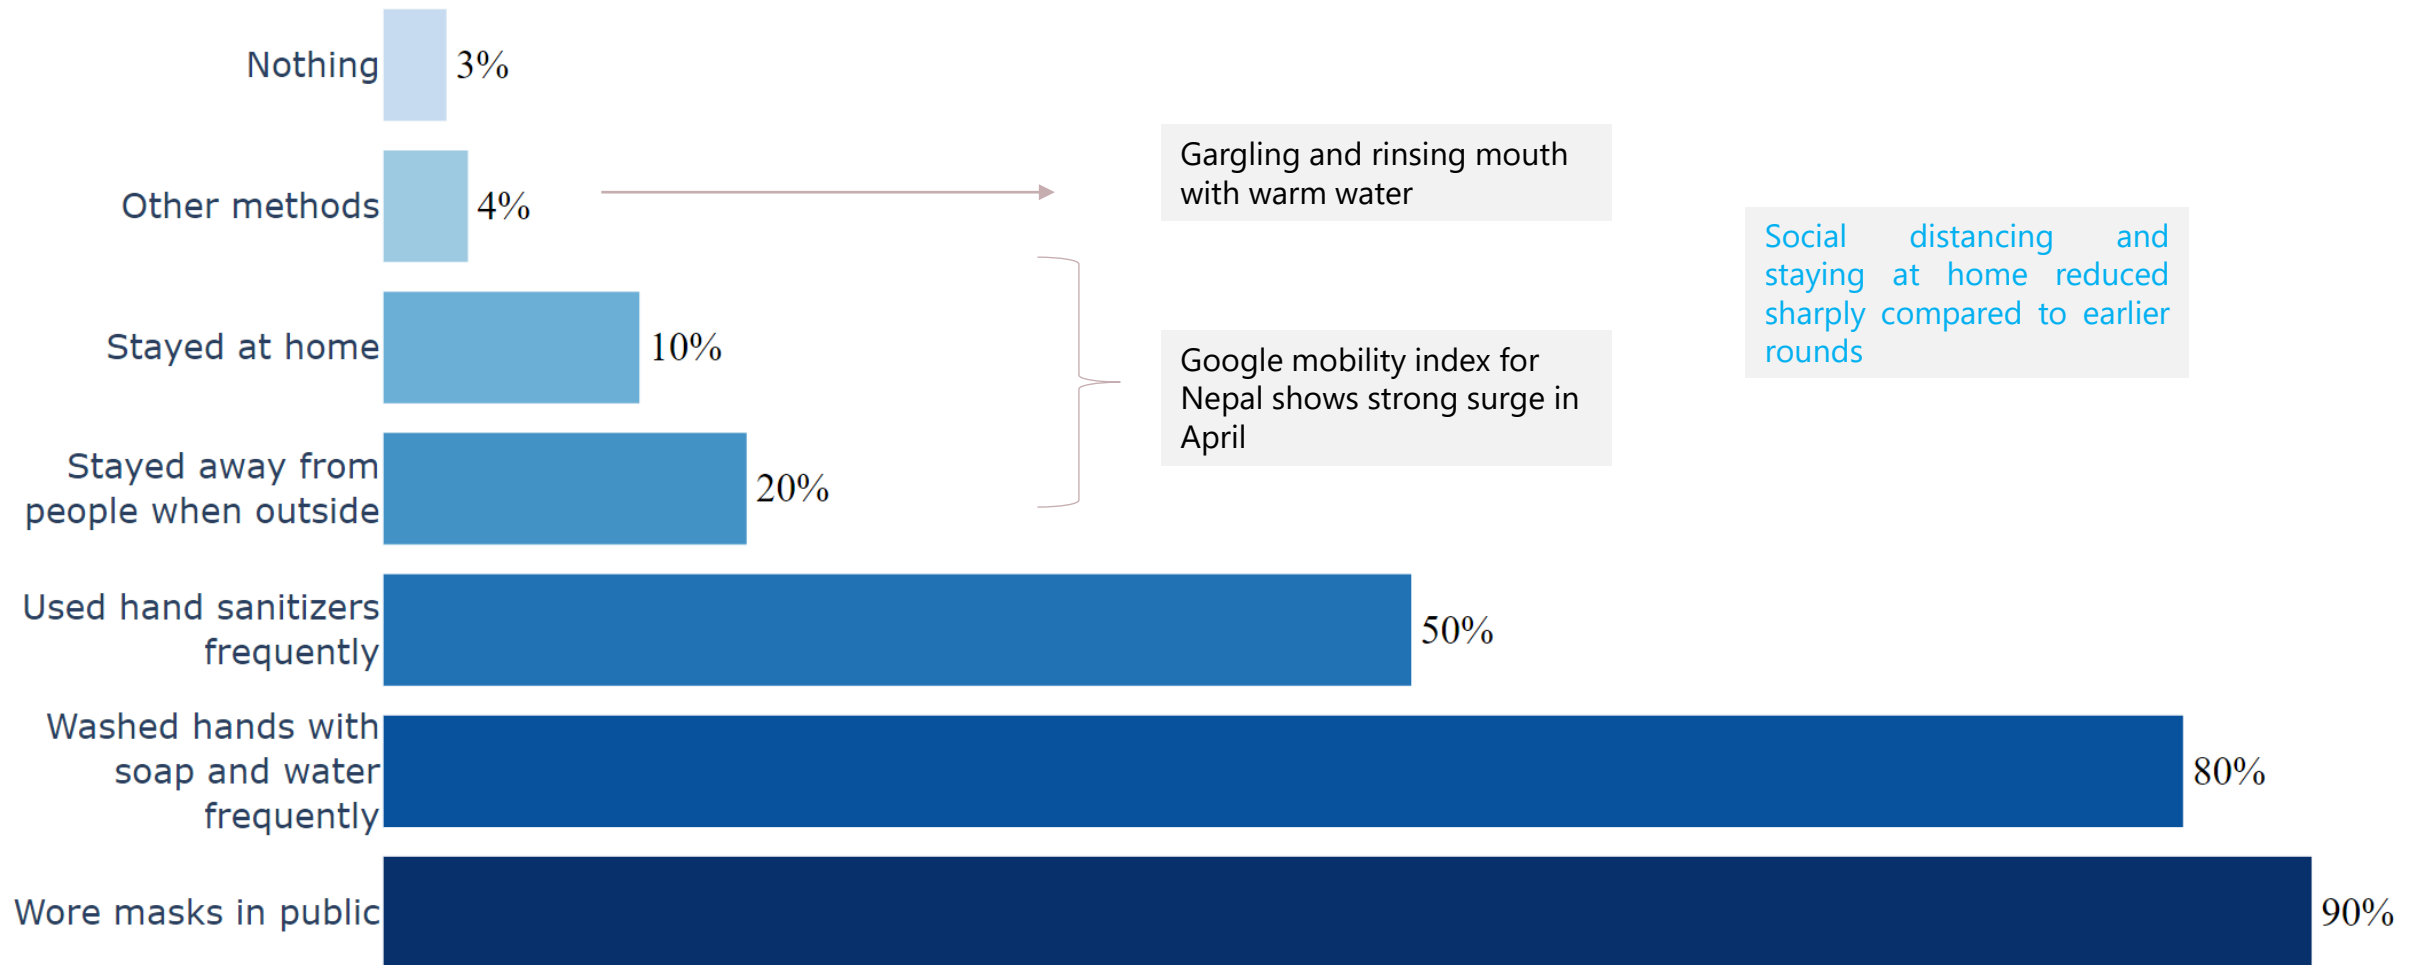

2.9: Financial coping through government support, by Province

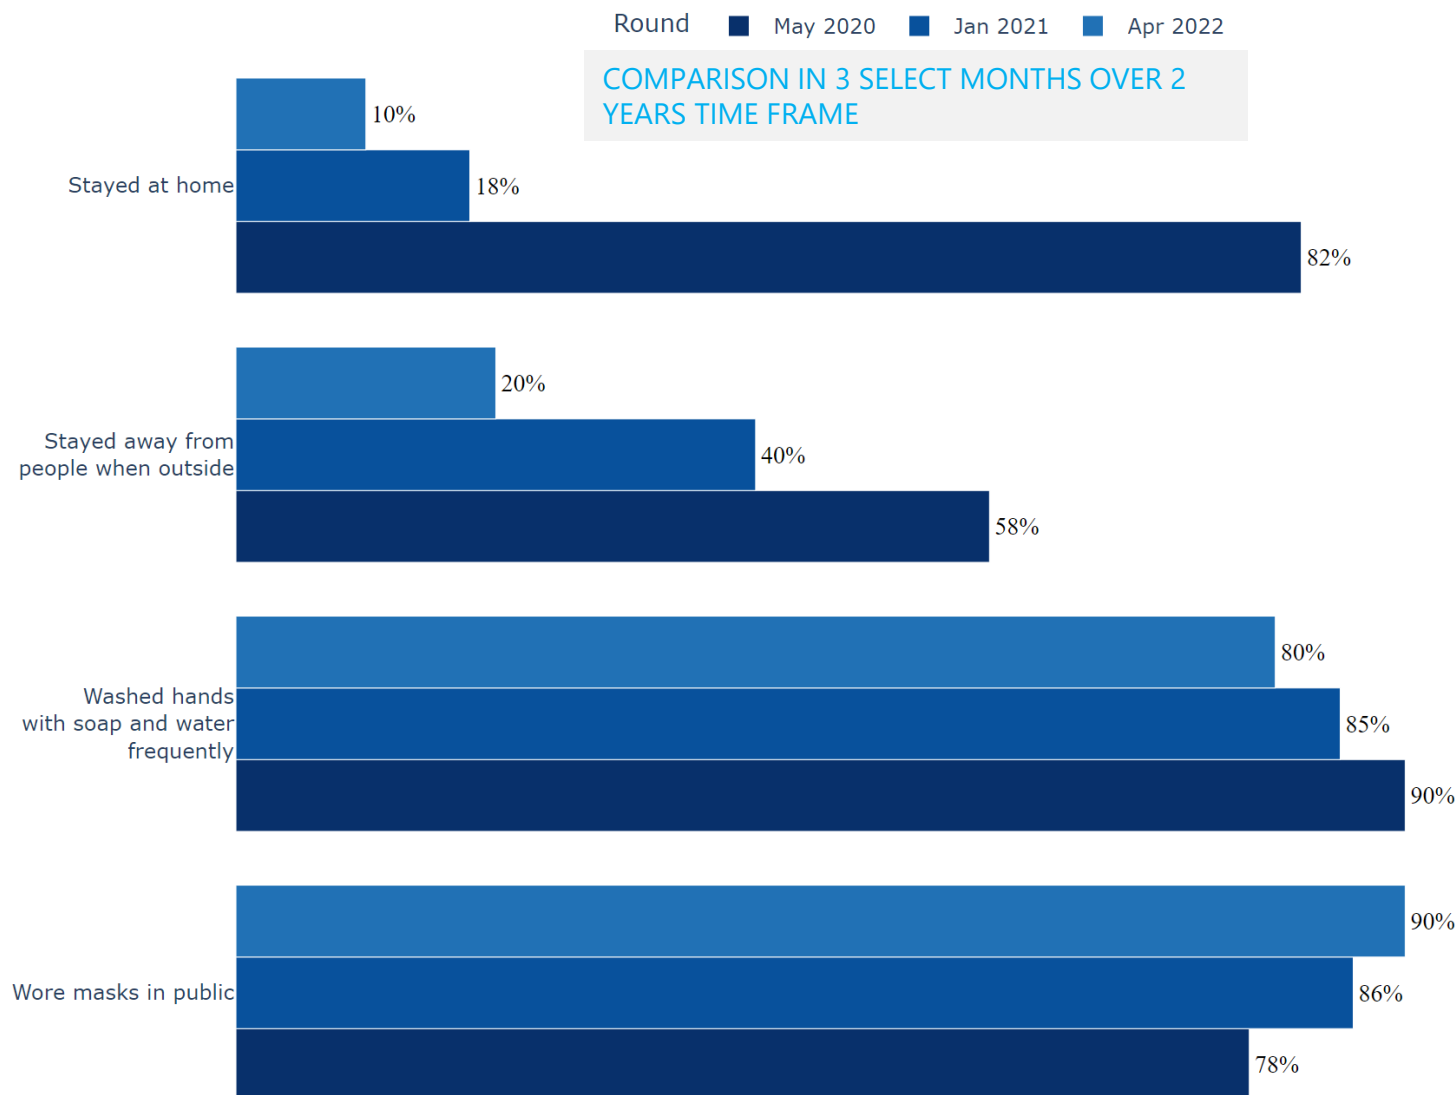

SAFETY & BEHAVIOUR: COVID-19

1.1: During the past week, what did you do to protect you and your family from COVID-19?

Comparing family and respondent behaviour to stay safe: May 2020, Jan 2021, Apr 2022

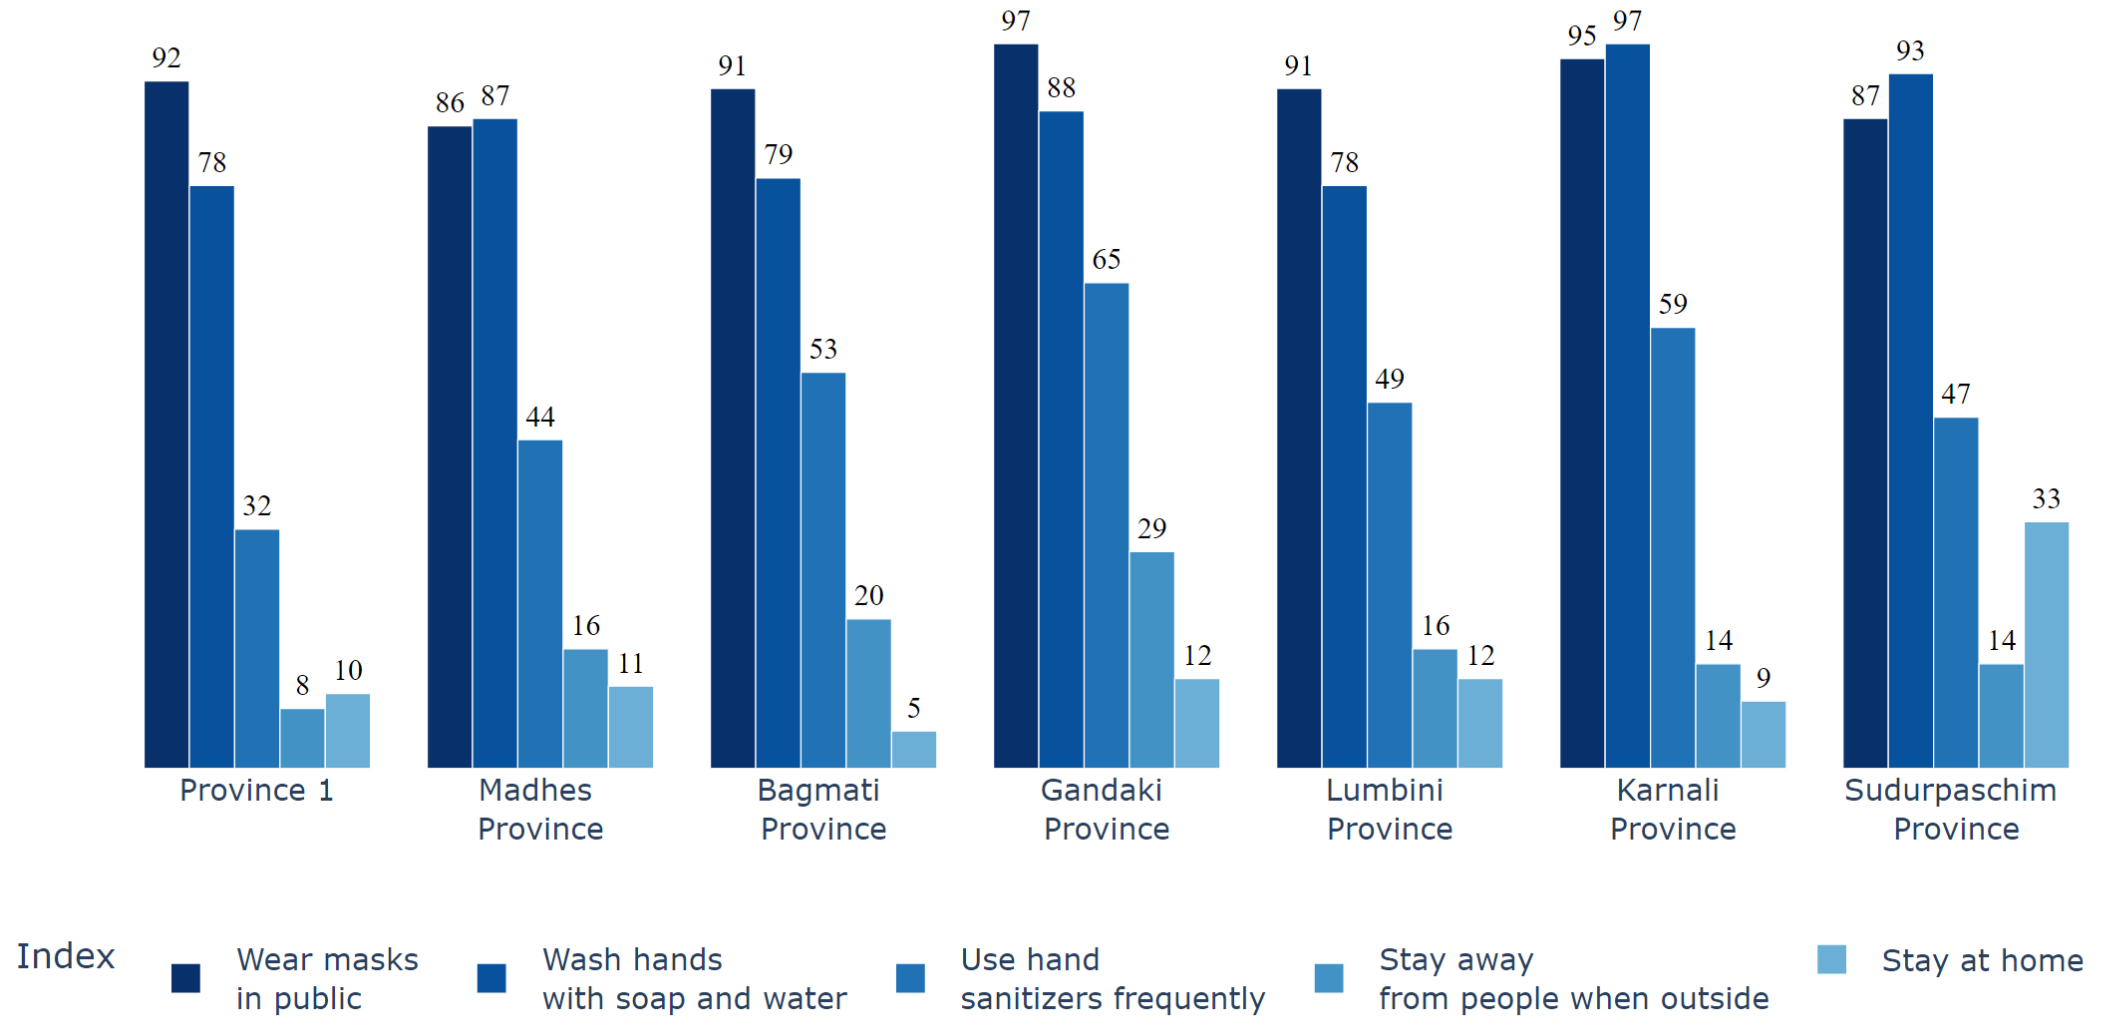

Expected decline in social distancing and staying at home compared to May 2020 when there were more stringent restrictions

10% point drop in handwashing behavior compared to May 2020

12% point increase in mask usage in public compared to May 2020

Safety behaviour by province (%)

1.2,1.3,1.4: How often did you practise safe behaviour? (1 week recall)

index

- All of the time
- Most of the time
- Sometimes
- Rarely
- Never

All or most of the time:
 2m distance 15%
 Face mask 74%
 Wash hands 98%

Effective mask coverage at 30% slightly lower than in Jan 2021 (32%)

Effective mask coverage:
 % wearing a mask for safety (90%) times % wearing mask at all times (33%)

Likelihood of getting COVID-19 and vaccination status of family

1.5: How likely do you think you or someone in your household will get COVID-19

1.7: Are all your family members vaccinated against COVID-19

Less than 10 per cent felt somewhat likely or very likely that someone in their families could get COVID-19. More than 1/3rd reported all their family members had taken COVID-19 vaccinations (All) while 2/3rd reported only some members of their families had been vaccinated (partial).

Family members vaccinated against COVID-19

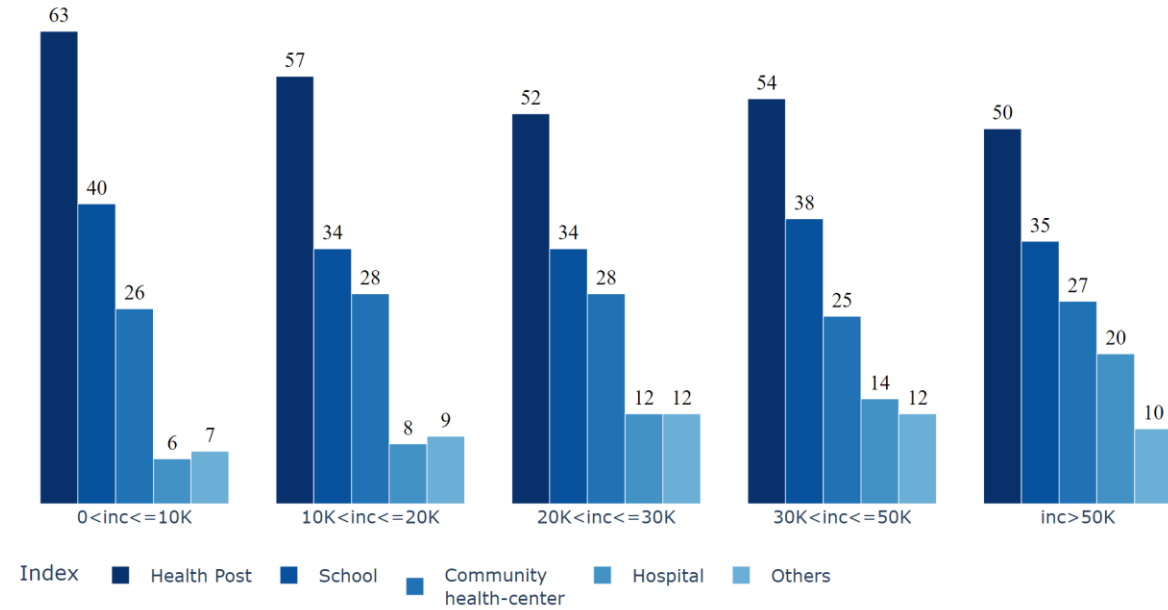

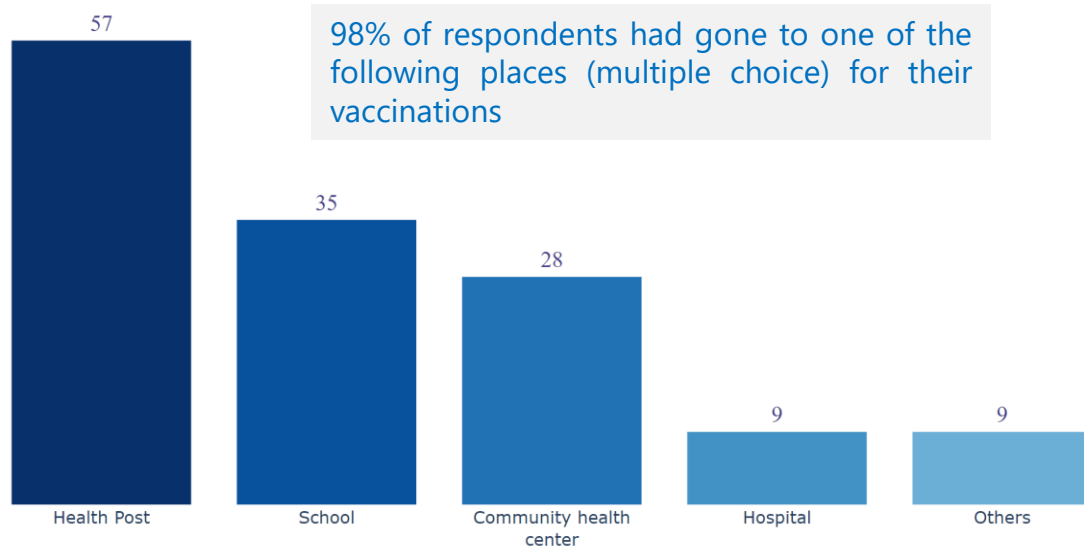

Sudurpaschim and Lumbini respondents were most likely to report their whole families being vaccinated ('All') whereas Madhesh province respondents were the most likely to have some family members vaccinated (partial).

Where respondent received vaccination and safety

1.9: Where did you get vaccinated: by income group

1.9: Where did you get vaccinated?

1.10: How safe did you feel to get vaccinated?

98% respondents reported going to one of these places. Most respondents got vaccinated at health posts and schools in their communities. Upper income groups more likely to visit hospitals and private facilities (others) 2/3rd felt very safe getting the vaccine and just under 1/3rd felt mostly safe

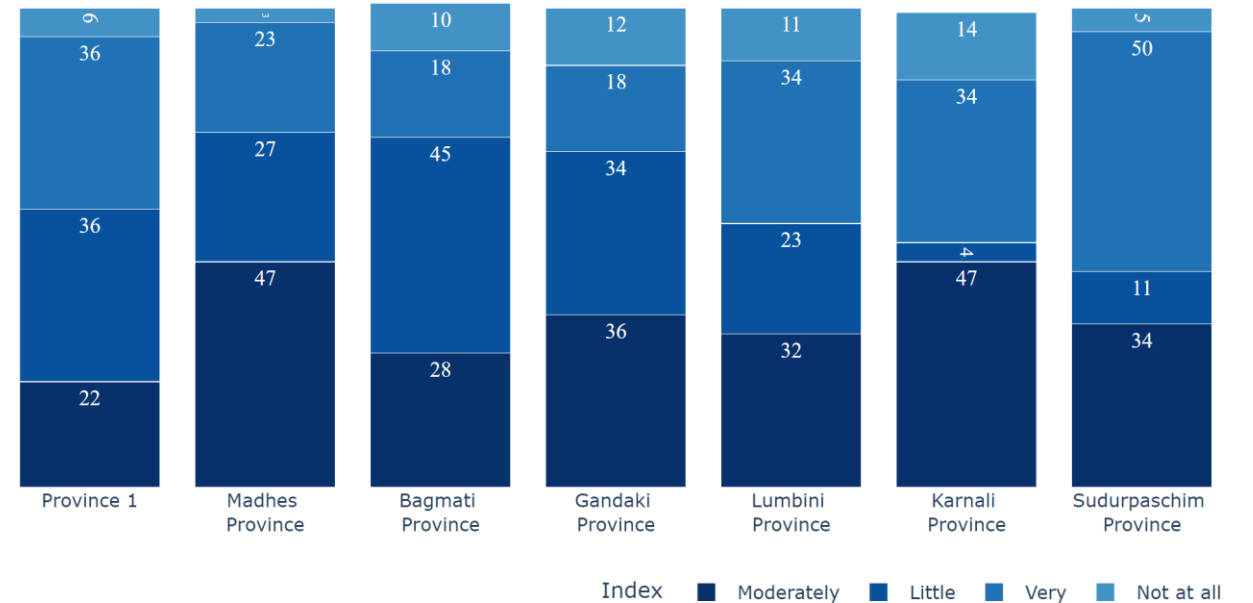

Ease of getting vaccinated

1.11: How easy was it for you and your family to get a COVID-19 vaccine?

34% respondents felt it was moderately easy to get COVID-19 vaccine
 37% felt it was difficult: only little easy (29%) or not at all easy (8%)
 Most cited difficulties related to queueing time, crowded facilities, inconvenient times

1.11: How easy was it for you and your family to get vaccinated, by Province

Karnali and Madhes provinces reporting moderately easy or very easy.

More than 10 per cent reported not at all easy in Bagmati, Gandaki, Lumbini & Karnali

HMIS Data: As compare to 2nd January 2022 data, significantly increased vaccine uptake in 30th March data, and it is because vaccination campaign was intensified through the establishment while adding new session sites.

1.15: In your opinion, what advantages does COVID-19 vaccine have for humans

1.16: In your opinion, what disadvantages does COVID-19 vaccine have for humans?

OTHER COVID-19 RELATED

- **99.2 per cent** would recommend the vaccine to others
- **25.4 per cent** had already taken booster vaccine while **73 per cent** were willing to take it when available
- Required conditions for self-isolation
 - Masks 95%
 - Sanitizer 79%
 - Vaporizer 76%
 - Thermometer 44%
 - Gloves 34%
 - Home delivery 17%
 - **Has challenges 11%**
 - No challenges 1.3%

EDUCATION

unicef 
for every child

q2_15: Type of school children attend

q2_15: Type of school, by income

q2_15: Type of school, by province

Type of school respondent's children attend

- 99 per cent reported their children were going back to school
- 64 per cent responded their children were in community schools. 44% responded their children were in private schools
- Students from upper income households were much more likely to be studying in private schools
- Respondents from Sudurpaschim, Karnali and Lumbini were least likely to have children in private schools

2.16: Are you confident that your children's schools operate safely and regularly

Confidence by type of school

variable Not confident Confident DK/CS

q2_16: Confidence about child school, by province

q2_16 No Yes DK/CS

Confidence about school operating safely and regularly

- 82 per cent reported feeling confident that schools would operate safely and regularly but 17 per cent were not confident.
- Respondents from Karnali were the least likely to feel confident
- Respondents sending their children to private schools were slightly more likely to be confident and slightly less likely to not feel confident. However difference is not statistically significant

Improvement in confidence over last three rounds (40%,60%,80+%)

q2.17: Does your children have? (Per cent responding yes)

q2.17: Access to education items by income

q2.17: Access to education items by type of school

Access to educational items

- Nearly all respondents reported their children had school textbooks.
- However less than half the respondents reported their children having other educational items such as story books etc.
- Strong variation by income group as well as type of school

2.18: What COVID-19 preventive measures are in place in your child's schools

School preventive measures by income

Respondent reporting schools doing nothing by Province

Respondent's awareness of preventive measures in schools

- Compulsory masks and hand washing main COVID-19 preventive measures in schools
- 15 per cent respondents reported that schools were doing nothing.
- Respondents from poorer households were more likely to report their schools doing nothing and less likely to report other preventive measures
- More than 1 in 4 respondents from Madhes Province reported schools doing nothing

Respondent's perception of whether child had forgotten learning/fallen behind

2.19: Do you think your children have forgotten their learning and fallen behind?

q2_19: Do you think your children have forgotten their learning and fallen behind, by type of school

q2_19: Do you think your children have forgotten their learning and fallen behind, by income

- 50% feared their children were falling behind. Strong improvement compared to CFT Round 8 (80+%).
- Respondents from Karnali significantly more likely to report their children falling behind while those from Madhes and Province 1 less likely
- Respondents with children in private schools were less likely to report children falling behind
- Lower income households much more likely to report children falling behind
- More than 66% of respondents who were struggling for food also reported their children were falling behind
- 60% of those whose immediate needs were food, employment or financial assistance reported their children had fallen behind.

What were schools doing to catchup when closed?

2.21: What measures are being implemented by schools to catchup learning?

Nearly 50% responded schools were not doing anything

2.22: What modalities are useful in catching up?

2.21: What are schools doing to catchup?

What are schools doing to catch up versus falling behind

CHILD PROTECTION AND PSYCHOSOCIAL HEALTH

Per cent of respondents reporting noticing violent/discriminatory behaviour witnessed against women, girls and boys

2.24: What forms of violent/discriminatory behaviour have you noticed towards women?

2.25: What forms of violent/discriminatory behaviour have you noticed towards girls?

2.26: What forms of violent/discriminatory behaviour have you noticed towards boys?

- 13% reporting noticing or witnessing violence/discrimination against women, 5% against girls, 3% against boys
- Domestic violence, verbal abuse, intimidation, threatening, being beaten, physical and sexual abuse, menstrual isolation were the main forms of violence against women
- Child marriage, child labour, physical and sexual abuse – top forms of violence noticed regarding girls. Girls were also reportedly threatened and abandoned
- Child labour, physical violence, yelling and child marriage were the top forms of violence noticed regarding boys

Per cent of respondents noticing VAWC by income, province, job loss status and sector of employment

Noticed violence against women, children and boys, by income

Noticed violence against women, children and boys, by Province

Noticed violence against women, children and boys, by job loss status

Noticed violence against women, children and boys, by sector of employment

2.27: Have you reported any violent behaviour to any one

- 80 per cent did not report any violent behaviour
- 15 per cent reported – mostly to police and local authorities
- Higher income respondents were less likely to report. Residents from Karnali significantly less likely to report while those from Province 1 significantly more likely to report
- Most common reason for not reporting was not feeling like airing or making public something that could be a private matter

2.30-2.32: Noticed adolescent marriage, child trafficking and are your children working?

29 per cent reported noticing marriage before 18 while **8 per cent** reported their children were working for them, mostly as unskilled labour or daily wage earners. **7 per cent** noticed child trafficking. There is variation by province and income

Noticed child right violations, by Province

Noticed child right violations, by income

Income effect only visible for child labour as upper income households are much less likely to report their children working

2_35: Top concerns about children and their safety and wellbeing

35 per cent of respondents had no concerns about their children. The remaining 65 per cent of households reported their top concerns as shown below. The top 3 concerns centered around increased social media usage (53%), smoking/drinking (36%), bad company (34%)

Children showing signs of mental/psychosocial stress?

2.36: Are your children showing any signs of mental stress?

4 out of 5 respondents reported their children were not showing any signs of mental/psychosocial stress

Most respondents reported boys were showing these signs

2.36: Children are showing the following signs?

Of those who reported their children were showing some signs, an overwhelming majority reported increased aggression (74%), some reported changes in dietary habits (30%), crying more, feeling withdrawn and worrying about family being sick

15% sought support. 73% did not. 11% not aware they could seek support

Anger/aggression by Province, income and whether child had fallen behind in school (20 per cent of respondents who reported their children showing signs of stress)

Per cent reporting increased anger/aggression by Province

Per cent reporting increased anger/aggression by income

Per cent reporting increased anger/aggression by whether child had fallen behind?

- Respondents from Karnali were significantly more likely to respond their children were showing signs of anger/aggression
- Respondents from top income group significantly more likely to report increased anger/aggression among their children
- Linked to falling behind in school among other variables?

Access to counselling and the demand to be linked to service providers

77% respondents had access to counselling services from health care workers in their localities (purple dash)

45% of respondents would like to be linked to service providers (orange dash)

Respondents from Bagmati province least likely to have access to counselling

Respondents from Sudurpaschim were the most likely to demand being linked to service providers while demand from Gandaki respondents was the lowest

2.40: Would you like to be linked to a service provider?

2.39 & 2.40: Has access to counselling & would like to be linked to service providers

- Demand for service providers stems mostly from low income households
- UNICEF requested list of respondents requesting to be linked (please contact SPEE)

NUTRITION

Changes in child's dietary intake (6-23m, past day/night)

2.41: Has your child's (6-23m) dietary intake reduced?

2.41: Reduced dietary intake, by Province

- 93 per cent reported no change which implies 7 per cent reporting reduced dietary intake
- Lower income group respondents much more likely to report reduced dietary intake for children (11%)
- 20% respondents in Karnali reported reduced dietary intakes
- Respondents reporting job losses significantly more likely to report reduced dietary intake (19%)
- 13% respondents struggling for food reported reduced dietary intake

Response not strictly comparable to earlier rounds as we had asked this question for all children in earlier rounds without any age restriction

Changes in breastfeeding frequency

q2.42: How often is [name] breastfed now?

Trends: Per cent reporting changes in breastfeeding frequency

- 29% reported changes in breastfeeding frequency – lower than last two rounds but higher than rolling average for 9 rounds
- Equally split between feeding more and feeding less
- 3% stopped breastfeeding (lack of breastmilk and no reason at all were the most likely reasons for stopping breastfeeding)

Changes in breastfeeding frequency by province, income and other characteristics

2.42: Breastfeeding frequency, by Province

2.42: Breastfeeding frequency by income

- Sudurpaschim, Bagmati and Karnali are least likely to report breastfeeding the same. Highest rates of breastfeeding less reported by Sudurpaschim respondents while highest rates of breastfeeding more are from Karnali.
- Respondents struggling for food and experiencing job losses are more likely to report changes in breastfeeding
- Highest and lowest income groups least likely to report breastfeeding the same

Whether child (6-59m) had MUAC tape measurement in last two months and where?

2.44: Child (6-59m) screened using MUAC tape

2.45: Where was Child (6-59m) screened using MUAC tape

2.44: Child (6-59m) screened using MUAC tape, by province

- 23% respondents (494) had children who were screened using MUAC tape.
- Respondents from Sudurpaschim most likely to report screening and those from Madhes least likely to report screening
- Screening typically done by FCHV's at home or community while a significant number also were screened by health workers

Results of screening with MUAC tape

MUAC tape reading by income

Trends: Per cent worried child is/becoming too thin

Note: In round 9 'thin' refers to tape MUAC measurements that were yellow or red

MUAC reading, by province

- Overall 90 per cent readings 'green'
- Lower income groups slightly less likely to have 'green' readings
- More than 1 in 4 Karnali respondents had readings that were 'yellow'
- Respondents who were struggling for food, or declared food as a top three need were significantly less likely to report children with 'green' readings and much more likely to report children with 'yellow' or 'red' readings.
- Trends: In previous rounds we ask – 'worried about becoming too thin' – this round MUAC measurements for 6-59m age group. Values obtained are lower than previous two rounds (be careful in interpretation)

- 50% of those with whose children had yellow/green readings took child to receive treatment.
- Most common reason cited for not taking was 'other' and 'no money to travel'

CARE SEEKING AND HEALTH

Children's illness status last month, currently and whether sought treatment or not

2.49: Did your child become ill or had fever in the past month?

2.50: Is child currently sick or has fever for past week?

q2.51: Did you take your child to health facility/hospital

- 25% respondents reported children had fallen ill during the previous month (1440 respondents).
 - Of this group, 49% reported children were still ill or had fever during the past week (694)
 - From this group, 79% (551) sought treatment
- Compared to 8th Round, there is a decrease from 33% to 25%.
- Respondents from Gandaki and Bagmati province were most likely to report their children being ill or with fever last month
- Respondents from Sudurpaschim and Karnali most likely to report children were still sick/having fever

Most common reason for not seeking treatment was independent treatment by caregiver and illness not serious

Most common reasons for seeking treatment were fever, respiratory illness and food poisoning/diarrhoea

2.56: Did child under two get vaccinated?

84% reported their children had been vaccinated since beginning of 2022. Respondents from Gandaki and Bagmati were the least likely to report their children having been vaccinated since 2022. Respondents from Madhesh and Karnali provinces most likely to report having been immunized

Health seeking preference by Province and Income

2.58: Health seeking preference, by Province

2.58: Health seeking preferences, by income?

- **27% revealed preference for private facilities** – highest among all CFTs where this question was asked
- Residents from Bagmati, Madhes and Lumbini were more likely to seek private facilities
- Residents from lower income groups least likely to seek private facilities
- Similarly residents who had lost their jobs or declared food, employment or financial assistance were less likely to seek out private facilities

Pregnancies in the household currently

q2.61: Are there pregnant women in your household at the moment?

q2.62: Age of pregnant women in household

2.61: Are there any pregnant women in your HH, by province

2.61: Are there any pregnant women in your HH, by income

Deliveries and place of delivery in the household

2.64: Any deliveries within last two months in HH

2.65: Place of delivery

Highest delivery rates were in Madhes Province, Sudurpaschim and Karnali. 2% reported deliveries in their households during the previous two months. Over 90% delivered in health facility while about 5% delivered at home citing distance and fear of catching infection during delivery

WATER AND SANITATION

Access to water and toilets

2.67: Difficulty accessing water for... (netted of responses with no difficulty)?

2.68: Difficulty accessing toilets?

76% respondents did not have any difficulty accessing water. When these respondents are netted out we have for the remaining 24%:

- 89% respondents having difficulty accessing water for drinking. Especially higher in Karnali & Sudurpaschim
- 61% reported having difficulty accessing water for bathing, again highest in Karnali & Sudurpaschim
- 58% reported having difficulty accessing water for washing
- 57% reported having difficulty accessing water for cleaning

- 3.4% reported having difficulty in accessing toilets while 96.6% did not
- 9.2% of Sudurpaschim respondents reported having difficulty accessing toilets
- Water problems were the most common reason cited for having difficulty accessing toilets followed by having no toilet at home, having to share toilet with neighbours and toilets being broken
- Lack of resources/money most often cited as reason for not having own toilet
- Collapsed and/or damaged toilets most often cited for toilet not being functional

Differentials in access to water or toilets by income and other deprivations

Difficulty accessing water or toilets, by income

Difficulty accessing water or toilets, by other deprivations

- 25% (1 in 4) respondents reported having difficulties accessing water or toilets – most likely from bottom wealth quintiles
- Other background characteristics such as job losses, struggling for food daily, witnessing violence against women, girls or boys and declaring food, employment or cash as top 3 immediate needs are also strongly correlated with having difficulty accessing water or sanitation

UNICEF PROGRAMMES: AWARENESS & PARTICIPATION

Awareness of UNICEF programmes

2.73: Are you aware of any UNICEF programmes in your area?

2.73: Awareness of UNICEF programmes, by Province

2.73: Awareness of UNICEF programmes, by income

- Awareness of UNICEF programmes: 1 in 10 respondents aware
- Awareness highest among high income groups
- Awareness highest in Sudurpaschim followed by Karnali

BUT: awareness also higher among vulnerable groups such as those with food, employment or cash as immediate needs, those reporting job losses, those struggling for food

Participation in UNICEF programmes (only for those respondents who were aware of UNICEF programmes)

2.74: Participated in any UNICEF programmes in your area?

2.74: Participated in UNICEF programmes, by Province

Just under 10 per cent of respondents had heard of UNICEF programmes. Of this group, 67 per cent participated in any UNICEF programme in the area. Respondents from Sudurpaschim, Gandaki and Bagmati province were most likely to be participating in UNICEF programmes

TRENDS AND EQUITY

20 indicators to be analyzed through the lens of region, ethnicity, disability and gender of Hh head

TRENDS IN KEY VARIABLES: Trends suggest a recovery is in effect amidst concerns about families having to struggle for food

Trends: Per cent reporting job/livelihood losses

Trends: Per cent reporting having to struggle for food every day last month

Trends: Per cent of households at risk of income poverty

Household is considered at risk of income poverty if HH inc is <= 10K NPR last month

Trends: Per cent reporting having to incur debt to cope financially

TRENDS IN KEY VARIABLES: Concerns regarding breastfeeding, children becoming too thin and child labour

Trends: Per cent reporting changes in breastfeeding frequency

Trends: Per cent reporting they reduced dietary intake for children

Trends: Per cent worried child is/becoming too thin

Note: In round 9 (April 2022) 'thin' refers to tape MUAC measurements that were yellow or red

Trends: Per cent reporting children working

Note: Prior to lockdown in May 2020
31% reported children working in Hh

Trends: Per cent noticing VAWC

Note: Prior to July 2021
question refers to children only

Trends: Per cent reporting children showing increased anger/aggression
