ADVOCACY BRIEF
Breastfeeding and the International Code of Marketing of Breastmilk Substitutes

GLOBAL BREASTFEEDING ADVOCACY INITIATIVE

Breastfeeding gives all children the healthiest start in life. Breastmilk stimulates brain development and acts as a baby’s first vaccine. Breastfeeding lowers health-care costs, creating healthier families and a smarter workforce. It also protects mothers’ health. When mothers breastfeed, everyone benefits.

Still, worldwide, only 43 per cent of children younger than six months are exclusively fed breastmilk. By age two, only 46 per cent receive any breastmilk at all.

UNICEF and the World Health Organization (WHO) are leading a global Breastfeeding Advocacy Initiative to increase the political commitment for breastfeeding, which is one of the smartest investments a country can make.

The Breastfeeding Advocacy Initiative seeks to join forces with partners who are also working to realize the Sustainable Development Goals’ vision of a better world. Our aim is to integrate agendas, messages, and advocacy, so we can maximize our collective influence.

Together, we will go further than any of us could alone.

“Breastmilk substitutes (BMS) include all milk products—such as infant formula, follow-up formula, and growing up milks—marketed for use by infants and children up to 36-months old.”
CODE IMPLEMENTATION ENABLES INFORMED CHOICE

PROMOTION OF BREASTMILK SUBSTITUTES UNDERMINES BREASTFEEDING

The aggressive marketing of breastmilk substitutes creates a major barrier to breastfeeding. Studies show that these tactics reduce breastfeeding rates, putting both children’s and mothers’ health at risk. Consequently, countering this industry’s marketing practices and promoting the benefits of breastfeeding are top advocacy priorities.

Breastmilk substitutes (BMS) include all milk products—such as infant formula, follow-up formula, and growing up milks—marketed for use by infants and children up to 36-months old. Inappropriate and unnecessary use of BMS is associated with an increase in the risk of respiratory and diarrhoeal diseases, as well as an increase in deaths in children under five.

Despite the World Health Assembly’s prohibition on all BMS promotion, manufacturers still make unsubstantiated claims about the health benefits of their products. BMS manufacturers spend millions of dollars annually to promote their products. These efforts are highly successful, and the sales of BMS are projected to increase from US$45 billion in 2014 to US$71 billion in 2019.

The widespread promotion of BMS leads to the circulation of misinformation about breastfeeding which influences the decisions that families make about feeding their infants and young children. Aggressive marketing of BMS products influences nutritional decisions that impact children throughout their lives. This is why BMS products cannot safely be marketed in the same way as other food or dairy products.

PROTECTING BABIES AND PARENTS

In 1981, the International Code of Marketing of Breast-milk Substitutes (the Code) was adopted to protect families from the industry’s aggressive marketing tactics. The Code seeks to prohibit all advertising and other forms of promotion of BMS, bottles, and teats, either to health-care systems or to the broader public.

Since its adoption, the Code has been regularly updated by World Health Assembly resolutions, which have addressed new scientific evidence on breastfeeding and the BMS industry’s new products and promotional tactics. When the Code is successfully implemented, it protects families from the misinformation and commercial pressures that can dissuade women from breastfeeding.

Repeatedly, the World Health Assembly has called on governments to give effect to the provisions in the Code through national, legally-binding regulations. Unfortunately, the Code has not been uniformly implemented. And monitoring efforts have highlighted consistent violations in many countries. These violations include:

- Using advertising and social media to promote BMS, bottles, and teats to the general public and to health-care systems.
- Distributing free samples to mothers.
- Enticing customers to buy BMS products using sales inducements such as special offers or price reductions.
- Publicizing health claims on labels or other BMS materials.
- Idealizing BMS products in text or images.
- Providing free supplies of BMS, bottles, or teats to health facilities.
- Sponsoring the education and meetings of health workers.
KEY FACTS

- With US$50 billion in global sales in 2014, the BMS industry exerts considerable influence on infant and young child feeding.

- Reports by BMS companies and Euromonitor International suggest that implementing the International Code of Marketing of Breastmilk Substitutes impacts BMS sales.

- Regulating BMS marketing impacts child feeding:
  A 2000 study found that as the frequency of advertisements for BMS in a parenting magazine increased, breastfeeding rates reported the following year generally declined.
  Numerous studies have found that mothers who receive free formula samples when discharged from the hospital breastfeed less.

- Currently, 135 countries have implemented legal measures related to the Code. This number increased from 103 in 2011. Still, only 39 countries have enacted all provisions, a slight increase from 37 in 2011.

- Only 32 countries have the monitoring and enforcement mechanisms to ensure compliance with regulations, and even fewer report that their mechanisms are functional.

CALL TO ACTION

Countries have shown that breastfeeding rates can be dramatically improved within a short time period. Actions, policies, and programmes that support mothers at health facilities, home and work have been shown to significantly increase breastfeeding. We invite partners to join us in protecting families from the commercial pressures of the BMS industry. Together, we must:

- **Disseminate accurate information** about the value of breastfeeding and its importance as a powerful tool for early childhood development, brain development and healthy families.

- **Increase investments in breastfeeding** and include funding to implement the Code through national, legally-enforceable regulations with independent monitoring mechanisms and deterrent sanctions.

- **Advocate for the adoption of or strengthening of legislation to fully implement the Code** and subsequent relevant World Health Assembly resolutions, including advocating for legislation that covers all breastmilk substitutes including infant formula, follow-up formula, and toddler and growing-up milks for children up to 36-months-old in accordance with the Code and WHO guidelines.

- **Become a monitor of the International Code of Marketing of Breastmilk Substitutes** and report violations to the relevant authorities.

- **Advocate with the medical profession** and other professional associations to increase dissemination of the Code and improve capacity development so all health workers know their obligations and avoid being used to promote products made by the BMS industry.
