## **Acknowledgements**

This report was prepared by Rebecca Kirby and Kara Palamountain from Northwestern University with input from UNICEF and other stakeholders. The document summarizes consensus achieved at a meeting on target product profiles for newborn care in low-resource settings, convened by NEST360°. This document was finalized following consideration of all comments and suggestions made by meeting participants at the Consensus Meeting.

NEST360° is made possible by generous commitments from the John D. and Catherine T. MacArthur Foundation, the Bill & Melinda Gates Foundation, The ELMA Foundation, the Children's Investment Fund Foundation, The Lemelson Foundation, the Ting Tsung and Wei Fong Chao Foundation and individual donors to Rice 360°.

## **Note to the reader**

Because of the richness of the discussion, and in an attempt to keep this report simple and readable, this report aims to convey the themes addressed in each session, rather than attempting to provide a chronological summary of the dialogue.

*Disclaimer: The TPPs do not replace or supersede any existing UNICEF TPPs. The TPPs do not constitute tender specifications, nor is UNICEF bound to tender or procure products that arise as a result of these TPPs. UNICEF may require regulatory approval and proof of compliance to quality management and product-specific international standards for tendering purposes.*

---

# INTRODUCTION

---

Access to diagnostic laboratories remains a key challenge in low-resource settings [1]. Point-of-care diagnostic tests can therefore enable health-care workers to provide more rapid and effective care [2]. Simple, rapid, and affordable point-of-care tests which require minimal or no electricity, a laboratory, or highly trained staff, are now available and widely used for several common conditions in low- and middle-income countries (LMICs) [3]. These point-of-care tests offer an unprecedented opportunity to reduce inequalities in health, and to help LMICs achieve the health-related Sustainable Development Goals (SDGs) [4,5].

Hemoglobin concentration refers to the amount of the oxygen-carrying protein in the blood, and is a diagnostic for anemia (low hemoglobin) or polycythemia (high hemoglobin).

---

# DEVELOPING A TARGET PRODUCT PROFILE

---

## Overview

Manufacturers need Target Product Profiles (TPPs) at an early stage in the medical device and diagnostic development process. These TPPs help inform the ideal targets and specifications and align with the needs of end users. TPPs outline the most important performance and operational characteristics as well as pricing. In the TPPs to follow, the term “Minimal” is used to refer to the lowest acceptable output for a characteristic and “Optimal” is used to refer to the ideal target for a characteristic. The Optimal and Minimal characteristics define a range. Products should meet at least all of the Minimal characteristics and preferably as many of the Optimal characteristics as possible. TPPs should also specify the goal to be met (e.g. to initiate treatment), the target population, the level of implementation in the healthcare system and the intended end users.

For the NEST360° Newborn Care in Low-Resource Settings Target Product Profiles, an initial set of TPPs were developed listing a proposed set of performance and operational characteristics for 16 product categories. The development timeline envisioned in the TPPs was four years, although some commercially available technologies may fit some of the criteria already. For several of the characteristics, only limited evidence was available and further expert advice was sought from additional stakeholders.

## Delphi-Like Process

To obtain this expert advice and to further develop the TPPs, a Delphi-like process was used to facilitate consensus building among stakeholders. The initial TPPs were sent to a more comprehensive set of stakeholders including clinicians, implementers, representatives from Ministry of Health, advocacy organizations, international agencies, academic and technical researchers and members of industry. In total, 103 stakeholders from 22 countries participated in the TPP development process via survey.

8 respondents participated in the Delphi-like survey for the Hemoglobinometer.

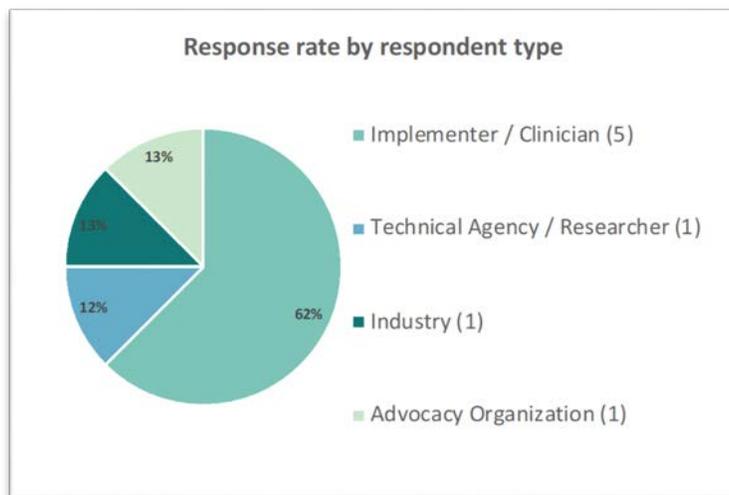

Survey respondents were requested to provide a statement on their level of agreement with each of the proposed characteristics for each TPP. Agreement was scored on a Likert scale ranging from 1 to 5 (1=disagree, 2=mostly disagree, 3= neither agree nor disagree, 4=mostly agree, 5=fully agree) with an option to opt out with the selection of “Other - Do not have the expertise to comment”. If participants did not agree with the characteristic (i.e., selected 3 or below) they were asked to provide an explanation with comments. Participants who agreed with the statements could also provide comments however were not explicitly asked. In total, over 1,780 comments were reviewed and summarized in this report.

For each characteristic in each product category, a percentage agreement was calculated for both the Minimal and Optimal requirements. The percentage agreement was calculated as the ratio of the sum of number of respondents who selected 4 and 5, to the sum of numbers of respondents who gave any score (from 1 to 5 where 5=fully agree, 4=mostly agree, 3=neither agree nor disagree, 2=mostly disagree and 1=disagree). Consensus for the survey characteristics was pre-specified at greater than 50% of respondents providing a score of at least 4 on the Likert scale.

A classic Delphi process requires at least two rounds of survey ahead of an in-person meeting. Initially, two rounds of the survey were planned, but since 50% consensus for most characteristics was reached after the first round survey, a second round survey was not initiated. Survey results are detailed by characteristic in the individual product category sections.

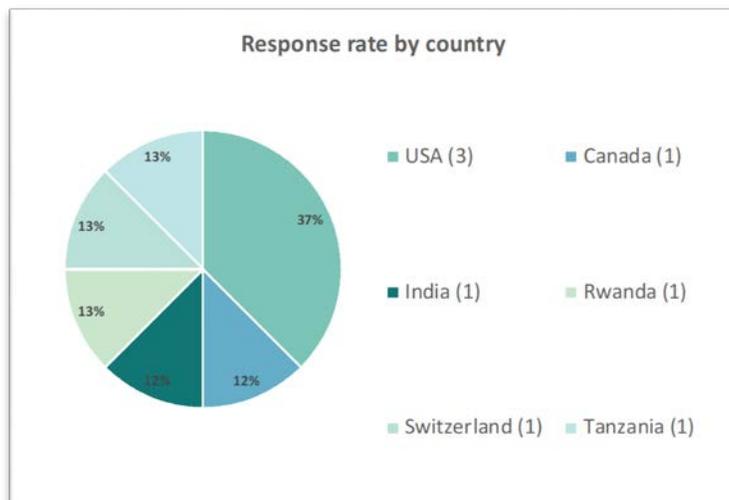

In total, over 180 organizations/individuals were asked to participate in this Delphi-like survey process, of whom 103 (see Appendix A) responded (response rate, 56%). Survey respondents were asked to self-disclose their affiliation.

**Figure 1: Summary of organizational affiliation for Hemoglobinometer TPP from Delphi-like Survey prior to Consensus Meeting (data as of Oct 25, 2019)**

Respondent type	Percentage
Implementer / Clinician (5)	63%
Technical Agency / Researcher (1)	13%
Industry (1)	13%
Advocacy Organization (1)	13%

**Figure 2: Summary of response rate by country for Hemoglobinometer TPP from Delphi-like Survey prior to Consensus Meeting (data as of Oct 25, 2019)**

Country	Percentage
USA (3)	38%
Canada (1)	13%
India (1)	13%
Rwanda (1)	13%
Switzerland (1)	13%
Tanzania (1)	13%

# Consensus Meeting

On November 20 - 22, 2019 over 69 stakeholders gathered in Stellenbosch, South Africa to focus on building further consensus on areas of discrepancy in opinion within the 16 TPPs. More specifically, characteristics on which fewer than 75% of the respondents agreed, or on which a distinct subgroup disagreed, were discussed. Consensus Meeting moderators presented the results and comments from characteristics with <75% agreement from the Delphi-like survey, the moderators then solicited additional feedback on each characteristic with <75% agreement from the Consensus Meeting participants, and then a proposed change to the TPP characteristic was discussed amongst Consensus Meeting participants. In some cases, Consensus Meeting participants nearly universally agreed on proposed changes. In other cases, Consensus Meeting participants failed to reach 75% consensus on proposed changes. If consensus was not achieved after two votes on proposed changes, meeting participants agreed to move forward and the disagreement is noted in this report.

**Methodology for Mentimeter Voting Results:** Certain proposed changes to TPP characteristics, for which a distinct subgroup disagreed, were anonymously voted on using Mentimeter.com to determine the overall level of agreement and disagreement amongst the Consensus Meeting participants. The Mentimeter Voting Results are presented throughout this report in three distinct categories:

- I. Overall vote – Includes all Consensus Meeting participants who voted on Mentimeter.com. To eliminate the possibility of duplicate votes, all respondents were asked to enter their name (to be viewed only by the report authors) and blank (potentially duplicate votes) were eliminated from the overall vote.
- II. Clinicians – Includes all Consensus Meeting participants who voted on Mentimeter.com and who designated themselves as a Clinician on Mentimeter.com.
- III. Excluding involvement with product development - Includes all Consensus Meeting participants who voted on Mentimeter.com minus those who indicated on a Declaration of Interest form that they are ‘currently or have been involved in the development of a candidate technology or product’ specific to the Product Category being voted on.

Of the 133 stakeholders that were invited to the meeting, 69 participants were able to attend. Participants comprised country representatives, stakeholders from technical and funding agencies, researchers, implementers and civil society organizations, and representatives from companies working on newborn care technologies (see Appendix B for the Consensus Meeting Participant List). An overview of the discussion for Hemoglobinometer and final consensus achieved is included in this report. Most characteristics discussed are presented in this report, however, overarching characteristics that applied to all product categories were discussed in unison and are included in the NEST360° Newborn Care in Low-Resource Settings Target Product Profiles. These characteristics are: Target Operator; Target Population; Target Setting; Quality Management; Regulation; User Manual/Instructions; Warranty; Power Source; Battery; Voltage; Power Consumption.

# FINAL TPP - HEMOGLOBINOMETER

Final target product profile for Hemoglobinometer		
Characteristic	Optimal	Minimal
<b>SCOPE</b>		
Intended Use	Quantitative determination of hemoglobin in capillary, venous, or arterial whole blood	
Target Operator	For use in low- and middle-income countries by a wide variety of clinicians, including nurses, clinical officers, and pediatricians	
Target Population	Neonates (born at any gestational age and require ongoing care)	
Target Setting	Hospitals in low-resource settings	
<b>SAFETY AND STANDARDS</b>		
Quality Management <sup>1</sup>	ISO 13485:2016 Medical devices – Quality management systems -- Requirements for regulatory purposes	
Regulation	At least one of: CE marking, approved by US FDA or another stringent regulatory body of a founding member of IMDRF (e.g., Japan or Australia or Canada)	
<b>TECHNICAL CHARACTERISTICS</b>		
Linear Range	0-25 g/dL	4.5-25 g/dL.
Accuracy	± 1 g/dL <sup>2</sup>	± 1.75 g/dL <sup>2</sup>
Results Format	Quantitative across whole linear range	Quantitative; semi quantitative below 5 or above 25 g/dL
Result Units	g/dL OR g/L	
Precision	1.5% CV	2% CV
Sample	Whole blood heel-stick sample <10 µL	Whole blood heel-stick sample <25 µL
Number of Steps	No more than 1-3 steps (requiring operator intervention)	No more than 4-6 steps (requiring operator intervention)
Calibration	No calibration	Minimal user calibration required
Kit Stability & Storage	Stable for >12 months with harsh ambient conditions (temperature 5-45 °C, humidity 15% to 95%, dusty air, elevation ≥2000 meters) and transport stress (48h with fluctuations up to 50°C and down to 0°C)	Stable for 12 months with harsh ambient conditions (temperature 10-40 °C, humidity 15%-95% elevation up to 2000 meters) and transport stress (48h with fluctuations up to 50°C and down to 0°C)
Equipment Required	Small, portable or hand-held device; device-free/disposable preferred	Small, table-top device; portable device optional
<b>PURCHASING CONSIDERATIONS</b>		
Instrument Pricing	<\$200 ex-works	<\$300 ex-works
Consumable Pricing	\$0.05 per test ex-works	\$0.50 per test ex-works
<b>UTILITY REQUIREMENTS</b>		

<b>Power Source</b>	No power required	Mains with rechargeable battery
<b>Battery</b>	None (i.e. a disposable test that requires no electricity)	Rechargeable battery, >100 tests on a single charge.
<b>Voltage</b>	None	Model must match the voltage and frequency of the purchasing country's local power grid (e.g., 110-120 VAC at 60 Hz or 220-240 VAC at 50 Hz)

<sup>1</sup> There was not 75% voting agreement on the Minimal characteristic. Please refer to the TPP Report discussion for additional detail.

<sup>2</sup> Source: <https://www.westgard.com/2019-clia-changes.htm>; CLIA proposed changes define Accuracy as  $\pm 4\%$ . Current CLIA standard is  $\pm 7\%$ . These changes are proposed as of Feb 2019.

*Disclaimer: This TPP does not replace or supersede any existing UNICEF TPPs. This TPP does not constitute tender specifications, nor is UNICEF bound to tender or procure products that arise as a result of this TPP. UNICEF may require regulatory approval and proof of compliance to quality management and product-specific international standards for tendering purposes.*

## Consensus Meeting Summary: Hemoglobinometer

To arrive at the final TPP for Hemoglobinometer, we conducted a pre-meeting survey to prioritize the items for discussion at the Consensus Meeting for characteristics that achieved below 75% agreement in the survey results. An overview of the discussion at the Consensus Meeting of these characteristics is included below.

### • Linear Range

- Consensus was achieved in the room (without a Mentimeter vote) for the Optimal and Minimal characteristic. Clinicians noted that 25 g/dL was appropriate for the upper range. For the lower range, clinicians were comfortable with a reading that accurately goes down to 4.5. One participant commented that the lowest reported levels of hemoglobin concentrations measured in blood was 0.6 g/dL [6]. Product developers noted that from a technical perspective, the incremental price to adjust the measurement range is dependent on the type of test. For example, it can be more challenging to get a wider range with a non-invasive test. Furthermore, participants commented that much less expensive tests can go down to 4-5 g/dL while more expensive tests are 0-25 g/dL.
- *Optimal: 0-25 g/dL*
- *Minimal: 4.5-25 g/dL*

### • Instrument Pricing

- Consensus was achieved in the room on the Minimal Instrument Pricing. Participants commented that less expensive tests currently exist for \$100-\$200, however, there is a wide range with more expensive ones at \$800-\$900 in price. Participants expressed concern over signaling the market with too high of a price and a vote was conducted in the room where the Minimal was agreed at \$300.
- *Minimal: Ex-works Instrument Price of \$300 vs. \$400*
  - Overall Vote - 73% voted "\$300" (n = 11)
  - Clinicians - 80% voted "\$300" (n = 10)
  - Excluding involvement with product development - 73% voted "\$300" (n = 11)

## Broad Themes and Considerations

At the Consensus Meeting, the following additional themes emerged and are summarized below:

### Instrument Pricing

In order to provide a consistent measure of pricing, the ex-works price is included in the TPPs. Participants highlighted that ex-works pricing is not a true measure of landed cost and is often vastly understated to what a procurement agent will pay. One participant from an international NGO noted that there is a "minimum 30% mark-up on the ex-works price." The rationale for using the ex-works price is that it is a reliable measure that can be used for consistent comparison across geographies since distributor markups vary by country and geography.

### Utility Requirements

A significant portion of the discussion was devoted to deliberating on how equipment can be designed to work in health facilities with limited electrical infrastructure. Designing the equipment for low-resource conditions often requires back-up batteries which adds to the expense of the technology, as well as the size of the equipment which can pose a challenge in crowded newborn wards. Some participants noted that rather than designing equipment for these facilities with limited electrical infrastructure, to consider whether a broader investment in electrical infrastructure would be a better use of funds. This inherent tradeoff was discussed multiple times when electrical characteristics were discussed.

Additionally, there were a variety of characteristics in the initial survey that related to Utility Requirements (i.e., electricity and power) that varied slightly in title across the TPPs. During the TPP Consensus Meeting, participants agreed that all characteristics relating to Utility Requirements (includes Back-up Battery; Battery Power; Batteries; Voltage; Power Requirement; Maximum Power Consumption; Response During Power Outage; Surge Protection, Electrical Plug) be reviewed and harmonized following the TPP meeting across the product categories. These characteristics have since been reviewed and harmonized into four distinct characteristics (Power Source, Battery, Voltage, and Power Consumption) in the final TPPs.

- **Power Source** - This defines the desired power source for the device and can be broken down into the following categories:
  - *Mains power* - device must be plugged into a mains power source for use
  - *Mains with battery backup* - device must be plugged into a mains power source for use, however, in the case of a power failure, the device has a battery backup that can last a specified period of time
  - *Mains with rechargeable battery* - device has a rechargeable battery that operates both when the device is charged by a mains power source, or, when the device is plugged in (e.g., a mobile phone)
  - *Battery is disposable and replaceable*
  - *No power required (i.e., disposable device)*
- **Battery** - This includes the length of time the rechargeable or disposable battery should function
- **Voltage** - This specifies the preferred voltage conversion if the Power Source utilizes Mains Power. Note that for certain technologies (i.e., Bilirubinometer, Glucometer, Hemoglobinometer, pH monitor, and Pulse Oximeter), the Voltage characteristic is included in reference to the rechargeable battery charger requirements. For example, while the Optimal Voltage characteristic is "None" (i.e., no charging is necessary), the Minimal Voltage characteristic should conform to "the voltage and frequency of the purchasing country's local power grid (e.g., 110-120 VAC at 60 Hz or 220-240 VAC at 50 Hz)" to ensure that the charger for the battery is compliant.
- **Power Consumption** - This specifies the maximum Watts of electricity that the device should consume

Ideally, all devices should be developed to withstand power surges and voltage spikes.

Note that comments received in the Pre-Meeting survey report highlighted the importance of the correct frequency in electrical plugs. It was noted that a universal adaptor would not safely support the conversion of

60Hz equipment to 50Hz and that a machine relying on this method could fail in a short period of time (applicable to Oxygen Concentrator, Warming Crib, Radiant Warmer).

## Delphi-like Survey: Hemoglobinometer

### Delphi-like survey results for Hemoglobinometer TPP prior to Consensus Meeting (data as of Oct 25, 2019)

Characteristic	Optimal		Minimal		Collated comments from Delphi-like survey
	Optimal requirement	% agreement (n size)	Minimal requirement	% agreement (n size)	
<b>Intended Use</b>	Optimal: Quantitative determination of hemoglobin in capillary, venous, or arterial whole blood.	<b>86%</b> n = 7	Minimal: Same as Optimal.	<b>83%</b> n = 6	2 comments as summarized below <ul style="list-style-type: none"> <li>• Optimally this would also give WBC and a neutrophil % to risk stratify for sepsis</li> <li>• Is this only measuring Hb? Not that it's bourne out to be great (but it's certainly better than nothing) it seems like we would also want this instrument to get WBC and maybe a neutrophil count? Unless you're on envisioning the utility of this as a rapid diagnostic for anemia NOT generalizable to use in sepsis (where rapid Hb assessment to determine need for transfusion is also important)</li> <li>• Minimal would be capillary whole blood</li> </ul>
<b>Target Operator</b>	Optimal: For use in low- and middle-income countries by a wide variety of clinicians, including nurses, clinical officers, and pediatricians.	<b>86%</b> n = 7	Minimal: Same as Optimal	<b>100%</b> n = 6	2 comments as summarized below <ul style="list-style-type: none"> <li>• With non-invasive it is no longer necessary for trained phlebotomists to take measurements</li> <li>• Optimal would be usable by community health workers as well</li> </ul>
<b>Target Population</b>	Optimal: Neonates (<28 days)	<b>57%</b> n = 7	Minimal: Same as Optimal.	<b>80%</b> n = 5	4 comments as summarized below Theme: Broaden the Target Population <ul style="list-style-type: none"> <li>• Ideally this could be used for infants, children and adults as well (not sure if it has to be specific to neonates because of HbF)</li> <li>• Required for other infants as well</li> <li>• Can be used across all ages</li> <li>• Optimal would be for neonates AND older infants and children</li> </ul>
<b>Target Setting</b>	Optimal: Hospitals in low-resource settings	<b>86%</b> n = 7	Minimal: Same as Optimal.	<b>100%</b> n = 6	2 comments as summarized below <ul style="list-style-type: none"> <li>• Target setting should include health posts and clinics in LMIC as many patients won't have access to a hospital</li> </ul>
<b>International Standard</b>	Optimal: ISO 13485:2016 Medical devices – Quality management	<b>100%</b> n = 3	Minimal: Same as Optimal.	<b>100%</b> n = 2	0 comments

	Optimal		Minimal		
	systems -- Requirements for regulatory purposes.				
<b>Regulation</b>	Optimal: CE marking or US FDA Clearance	100% n = 3	Minimal: Same as Optimal.	100% n = 2	0 comments
<b>Linear Range</b>	Optimal: 0-25 g/dL	86% n = 7	Minimal: Same as Optimal.	67% n = 6	2 comments as summarized below <ul style="list-style-type: none"> <li>Why is the range so high? 0-20 or even 2-20 seems more meaningful?</li> <li>I question anything above 17 as necessary</li> </ul>
<b>Accuracy</b>	Optimal: +-1 g/dL	83% n = 6	Minimal: +-1.75 g/dL	80% n = 5	2 comments as summarized below <ul style="list-style-type: none"> <li>Range of 3.5g/dL seems high to me?</li> <li>Way too strict, propose to update Optimal 7% and Minimal to 15%</li> <li>CLIA standards are 7%</li> </ul>
<b>Results Format</b>	Optimal: Quantitative across whole linear range	100% n = 6	Minimal: Quantitative; semi quantitative below 5 or above 25 g/dL	80% n = 5	2 comments as summarized below <ul style="list-style-type: none"> <li>I'd change minimal to "above 20"</li> <li>For neonates the transfusion threshold would be higher than 5 g/dL so that threshold seems too low in that age group (would be closer to 7.5-8.5, or even higher in the first week of life). Even for older children a higher value around 7 might be more appropriate</li> </ul>
<b>Result Units</b>	Optimal: g/dL OR g/L	100% n = 7	Minimal: Same as Optimal.	83% n = 6	1 comment <ul style="list-style-type: none"> <li>At a minimum, one of the units could be displayed, together with a conversion chart that comes with the machine</li> </ul>
<b>Precision</b>	Optimal: 1.5% CV	83% n = 6	Minimal: 2% CV	80% n = 5	2 comments <ul style="list-style-type: none"> <li>Theme: do not understand Characteristic</li> </ul>
<b>Sample</b>	Optimal: whole blood heel-stick sample <10 µL	100% n = 6	Minimal: whole blood heel-stick sample <25 µL	100% n = 5	1 comment <ul style="list-style-type: none"> <li>Noninvasive may be a first line measure prior to taking a blood draw</li> </ul>
<b>Number of Steps</b>	Optimal: No more than 1-3 steps (requiring operator intervention)	100% n = 6	Minimal: No more than 4-6 steps (requiring operator intervention)	80% n = 5	2 comments <ul style="list-style-type: none"> <li>Above 4 steps gets complicated</li> <li>Too many steps</li> </ul>

	Optimal		Minimal		
<b>Calibration</b>	Optimal: No calibration	100% n = 7	Minimal: Minimal user calibration required	83% n = 6	2 comments <ul style="list-style-type: none"> <li>There is significant drift in devices if they are not calibrated. Anything requiring a blood sample should be calibrated prior to the measurement. There are huge questions about the validity of global hemoglobin data from DHS for this (and other) reasons. Noninvasive devices require minimum to no calibration</li> <li>Preferably without calibration</li> </ul>
<b>Kit Stability &amp; Storage</b>	Optimal: Stable for >12 months with harsh ambient conditions (temperature 5-45 °C, humidity 15% to 95%, dusty air, elevation >=2000 meters) and transport stress (48h with fluctuations up to 50°C and down to 0°C)	100% n = 6	Minimal: Stable for 12 months with harsh ambient conditions (temperature 10-40 °C, humidity 15%-95% elevation up to 2000 meters) and transport stress (48h with fluctuations up to 50°C and down to 0°C)	100% n = 6	0 comments
<b>Equipment Required</b>	Optimal: Small, portable or handheld device; device-free/disposable preferred	100% n = 7	Minimal: Small, table-top device; portable device optional	100% n = 6	0 comments
<b>Power Requirement</b>	Optimal: None (i.e. a disposable test that requires no electricity)	100% n = 6	Minimal: 110-220V AC current; DC power with rechargeable battery lasting up to 8 hours of testing	86% n = 7	2 comments <ul style="list-style-type: none"> <li>1 question whether disposable tests have the accuracy required</li> <li>Solar power would be best if an energy source is needed and might be better than a disposable test to avoid bio-hazardous trash</li> </ul>
<b>Instrument Pricing</b>	Optimal: <\$200 ex-works	83% n = 6	Minimal: <\$800 ex-works	60% n = 5	2 comments <ul style="list-style-type: none"> <li>Still expensive for most LIC where the test may be highly required</li> <li>&lt; \$100 would be better</li> </ul>
<b>Consumable Pricing</b>	Optimal: \$0.05 per test ex-works	100% n = 5	Minimal: \$0.50 per test ex-works	80% n = 5	2 comments <ul style="list-style-type: none"> <li>Varies depending on what equipment is being used</li> <li>Too expensive for hemoglobin</li> </ul>

Casey Trubo (D-Rev)  
Chishamiso Mudenyanga (Clinton Health Access Initiative)  
Danica Kumara (3rd Stone Design)  
Daniel Wald (D-Rev)  
Edith Gicheha (Kenya Pediatric Research Consortium)  
Emily Ciccone (University of North Carolina - Chapel Hill)  
Emmie Mbale (PACHA)  
Grace Irimu (University of Nairobi)  
Guy Dumont (The University of British Columbia)  
Helga Naburi (Muhimbili National Hospital)  
Jeffrey Pernica (McMaster University)  
John Appiah (Kumfo Anokye Teaching Hospital)  
Jonathan Stryko (Children's Hospital of Philadelphia/Princess Marina Hospital)  
Joy Lawn (London School of Hygiene and Tropical Medicine)  
Lincetto Ornella (WHO)  
Liz Molyneux (College of Medicine, Malawi)  
Lizel Lloyd (Stellenbosch University)  
Mamiki Chise  
Marc Myszkowski  
Maria Oden (Rice University)  
Martha Franklin Mkony (Muhimbili National Hospital)  
Martha Gartley (Clinton Health Access Initiative)  
Mary Waiyego (Pumwani Maternity Hospital)  
Matthew Khoory (mOm Incubators)  
Melissa Medvedev (University of California, San Francisco; London School of Hygiene and Tropical Medicine)  
Msandeni Chiume (Kamuzu Central Hospital)  
Naomi Spotswood (Burnet Institute)  
Norman Lufesi (Ministry of Health Malawi)  
Pascal Lavoie (University of British Columbia)  
Queen Dube (College of Medicine, Malawi)  
Rachel Mbuthia (GE Healthcare)  
Rebecca Richards-Kortum (Rice University)  
Rhoda Chifisi (Kamuzu Central Hospital)  
Rita Owino (GE Healthcare)  
Robert Moshiri (Muhimbili National Hospital)  
Ronald Mbwasii (Kilimanjaro Christian Medical Centre)  
Sam Akech (KEMRI-Wellcome Trust Research Programme)  
Sara Liaghati-Mobarhan (Rice University)  
Sona Shah (Neopenda)  
Steffen Reschwamm (MTTS)

Steve Adudans (CPHD/MQG)  
Thabiso Mogotsi (University of Botswana)  
Walter Karlen (ETH Zurich)  
Zelalem Demeke (Clinton Health Access Initiative)

## Appendix C: Abbreviations

°C	Degrees Celsius
bCPAP	Bubble continuous positive airway pressure
bpm	Beats per minute / Breaths per minute
CE Mark	Conformité Européenne – certification mark
cm	Centimeters
cm <sup>2</sup>	Centimeter squared
CRP	C-reactive protein
CPAP	Continuous positive airway pressure
DHS	Demographic and health survey
FDA	Food and Drug Administration
HIS	Health information system
Hz	Hertz
IMR	Infant mortality rate
ISO	International Standards Organization
IV	Intravenous
KMC	Kangaroo Mother Care
kg	Kilogram
LPM	Liters per minute
LRS	Low-resource settings
MCH	Maternal and child health
MDG	Millennium Development Goal
Mg/dL	Milligrams per deciliter
mL/hr	Milliliters per hour
mmol/L	Millimoles per liter
µmol/L	Micromoles per liter
MMR	Maternal mortality rate
MNCH	Maternal, newborn, and child health
MNH	Maternal and neonatal health
nm	Nanometer
NMR	Neonatal mortality rate
PCT	Procalcitonin
PEEP	Positive end-expiratory pressure
PR	Pulse rate
RDS	Respiratory distress syndrome
ROP	Retinopathy of prematurity
SpO <sub>2</sub>	Peripheral saturation of oxygen
SDG	Sustainable Development Goal
TFR	Total fertility rate
U5MR	Under-5 mortality rate
UNFPA	United Nations Population Fund
USAID	U.S. Agency for International Development
uW	Micro Watts
W	Watt
WHO	World Health Organization
