Timor-Leste Food and Nutrition Survey

2020

Final report

PREFACE

The 2020 Timor-Leste Food and Nutrition Survey (TLFNS) is the second comprehensive food and nutrition survey carried out in the country. The 2020 TLFNS was conducted under the leadership of the Ministry of Health – Nutrition Department with financial and technical assistance from the United Nations Children’s Fund (UNICEF), European Union (EU), Korea International Cooperation Agency (KOICA), World Food Programme (WFP), Food and Agriculture Organization (FAO) and member of Timor-Leste nutrition working group.

The data collection for this survey was between June and September 2020 among children (0-59 months old) and their non-pregnant mothers (15-49 years old). The survey assessed the nutritional status and risk factors for undernutrition, including the factors affecting infant and young child-feeding practices of the same age group of children and non-pregnant mother.

Findings from the survey will be used in planning and implementing nutrition programmes in Timor-Leste. Furthermore, the results of the survey can also be used as baseline data to monitor the progress towards government initiatives to improve the nutrition situation in Timor-Leste.

On behalf of the Government of Timor-Leste, the Ministers of Health (MoH) would like to extend appreciation to the Consultant, who conducted the field studies, analysed the survey data, and wrote the report. Furthermore, the MoH realized that this survey would not be completed without the dedication from the 16 teams of four enumerators each and the participation of our partners who were directly or indirectly involved in the survey. Although we cannot mention it one by one, we would like to express our gratitude, especially to UNICEF and the European Union, for technical oversight and additional resources.

The MoH shared the preliminary findings during a press conference held by the MoH in November 2020, the presentation at a validation workshop with MoH’s relevant partners in February 2021. This report was completed in 2020 and is launched in 2021 by the Eight Government Constitution of Timor-Leste.

Finally, no matter how small the contribution of the results from this survey can make, hopefully, it will be useful to, and I encourage departments in the MoH, other relevant ministries, and partners to use the data in this report for nutrition programme planning and implementation to improve the nutrition situation in Timor-Leste.

dr. Odete Maria Freitas Belo, MPH
Minister of Health, Democratic Republic of Timor-Leste

Executive Summary

The report presents the results of the 2020 Timor-Leste Food and Nutrition Survey (TLFNS) which was conducted between 4 June and 18 September 2020 using 2-stage cluster sampling, in which the sample was stratified by municipality. The sample size, which was calculated using the SMART methodology, 992 households, in each municipality with 80 clusters and 12-13 households per cluster, which were selected using systematic random sampling. The total target sample was 12,896 households and 9,048 children. A total of 12,881 households and 11,246 children were surveyed.

Key findings

01

Nutritional status among children 0-59 months based on WHO 2006 standards

Anthropometry for children was assessed using WHO 2006 standards. The prevalence of stunting was 47.1% (46.2-48.0, 95% C.I), with a moderate and severe stunting prevalence of 30.2% (29.4-31.1, 95% C.I) and 16.9% (16.2-17.6, 95% C.I). The stunting prevalence was well above the WHO “very high” threshold of >30%. The prevalence of underweight was 32.4% (31.5-33.2, 95% C.I), with a moderate and severe underweight prevalence of 24.8% (24.0-25.5, 95% C.I) and 7.6% (7.1-8.1, 95% C.I), respectively. The prevalence of global acute malnutrition (GAM) was 8.6% (8.1-9.1, 95% C.I). The moderate acute malnutrition (MAM) was 7.1% (6.7-7.6, 95% C.I) and the prevalence of severe acute malnutrition (SAM) was 1.5% (1.2-1.7, 95% C.I). The prevalence of wasting was in the “medium” category of WHO classification. The general improvement in the nutrition situation continued, as stunting decreased to 47.1% compared to 50.2% in 2016 and 58.1% in 2010. Underweight decreased to 32.4% from 37.7% in 2016 and 44.7% in 2010. Wasting decreased to 8.6% compared to 11.0% in 2016 and 18.6% in 2010. The prevalence of acute malnutrition was much higher based on WHZ (8.6%) than MUAC (4.7%).

02

Morbidity, vaccination and supplementation for children 0-59 months

In terms of morbidity, 15.2% (14.5-15.8, 95% C.I) reported having experienced diarrhoea, with 9.9% (9.3-10.4, 95% C.I) for acute respiratory infection, and 23.5% (22.8-24.3, 95% C.I) for fever (without cough). The coverage of measles vaccination was 86.3% (83.5-89.2, 95% C.I), with 60.3% (59.2-61.4, 95% C.I) confirmed by the card. 77.8% (76.9-78.5, 95% C.I) of eligible children had received Vitamin A supplementation in the last 6 months, while the coverage of deworming was 71.4% (70.5-72.4, 95% C.I). The proportion of children who received micronutrient powder was 18.1% (16.9-19.3, 9% C.I).

© UNICEF/ 2016/ Soares

03

Infant and young child feeding for children 0-23 months

The proportion of children 0-23 months who were introduced to breast milk within the first hour after birth was 46.8% (45.2-48.4, 95% C.I). The prevalence of exclusive breastfeeding was 64.2% (61.4-67.0, 95% C.I). The prevalence of bottle feeding was 32.1% (30.7-33.4, 95% C.I). Continued breastfeeding at 1 year (12-15 months) was 68.4% (64.9-72.0, 95% C.I), and only 29.2% (24.9-33.6, 95% C.I) at 2 years (20-23 months). 75.8% (72.5-79.0, 95% C.I) had been introduced to solid foods at 6 months (6-8 months). The proportion of children 6-23 months who achieved a minimum meal frequency (MMF) was 52.3% (50.7-53.9, 95% C.I), and 35.3% (33.8-36.8, 95% C.I) met the minimum dietary diversity (MDD). Only 14.3% (13.2-15.4, 95% C.I) in the same age group met the minimum acceptable diet (MAD). In terms of the trend analysis, early initiation of breastfeeding has been on a general decline, while exclusive breastfeeding improved. There was an improvement in timely introduction of solid foods. Minimum dietary diversity remained unchanged, while minimum meals frequency and minimum acceptable diet decreased.

04

Health and nutrition status of women of reproductive age (15-49 years)

18.8% (18.1-19.5, 95% C.I) of non-pregnant women in the sample were underweight (BMI<18.5), while 19.3% (18.6-20.0, 95% C.I) were overweight/obese (BMI>=25). The prevalence of underweight decreased with age, while the prevalence of overweight/obesity increased with age. The prevalence of underweight decreased from 26.6% in 2016 to 18.8% in 2020, while the prevalence of overweight/obesity nearly doubled from 9.8% in 2016 to 19.3% in 2020. Based on MUAC for pregnant and lactating women, 8.9% (8.2-9.8, 95% C.I) had a low MUAC (below 21cm), with 23.2% (22.0-24.4, 95% C.I) at risk (21-22.9cm). For most women, the main provider of antenatal care were midwives (72.0%, 70.9-73.2, 95% C.I), followed by medical doctors (21.6%, 20.6-22.7, 95% C.I). Most women (64.1%, 62.9-65.4, 95% C.I) had 4-7 visits in their last pregnancy, while 19.0% (18.0-20.0, 95% C.I) received 8 or more visits. The minimum dietary diversity for women (MDD-W) was met by 65.4% (64.6-66.2, 95% C.I) of sampled women.

05

Wealth index

The asset-based wealth index ranked households in terms of asset ownership using principal component analysis (PCA). Only 11.6% of rural households were in the highest quintile compared to 44.7% of urban households. Ermera and Ainaro were the poorest municipalities in terms of the index which was calculated.

06

Food security

Of the sampled households, 35.1% (34.2-35.9, 95% C.I) had poor food consumption, while 29.9% (29.2-30.7, 95% C.I) had borderline food consumption and 34.8% (34.0-35.6, 95% C.I) had acceptable food consumption. Based on the Food Insecurity Experience Scale (FIES), 49.6% (48.7-50.5, 95% C.I) of households were classified as food secure/mild food insecure, 34.8% (33.9-35.6, 95% C.I) as moderate food insecure and 15.6% (15.0-16.2, 95% C.I) as severe food insecure.

07

Water, sanitation and hygiene

At national level, access to an improved sanitation facility at national level, 68.2% (67.4-69.0, 95% C.I) had access to an improved sanitation facility, and 52.2% (51.4-53.1, 95% C.I) had access to an improved excreta disposal facility. For nearly all households (87.1%, 86.5-87.7, 95% C.I), the main hand washing method was soap and water and a high proportion of households reported washing their hands before eating (80.0%, 79.3-80.7, 95% C.I), although a lower proportion reported washing their hands before cooking food (45.1%, 44.3-46.0, 95% C.I), after defecation (28.5%, 27.8-29.3, 95% C.I), and a much lower proportion after disposing child's faeces (6.1%, 5.6-6.5, 95% C.I) and before breastfeeding/feeding children (6.2%, 5.8-6.6, 95% C.I).

08

Determinants of stunting

The association between stunting and immediate, underlying and basic causes of malnutrition was analysed using logistic regression analysis. The results revealed that stunting was strongly associated with diarrhoea ($p<0.001$) and fever ($p<0.001$) in terms of morbidity. Stunting also showed strong association with education status of mother/caregiver ($p<0.001$), wealth quintile ($p<0.001$) and lack of access to improved sanitation ($p<0.001$). Wasting was associated with diarrhoea ($p=0.001$), fever ($p<0.001$) and wealth quintile ($p<0.05$).

Recommendations

01

Improving the Nutritional status among children 0-59 months

Increase the coverage of high-impact intervention to address the immediate and underlying causes of malnutrition, focusing on pre-pregnancy and the first 1,000 days to reduce all forms of malnutrition. Prevent and control wasting in children aged 0-59 months by providing community- and inpatient-based treatment and providing food supplements in food insecure areas. Implement a robust social behavior change communication for collective action, community ownership with integrated interpersonal communication (one-on-one counselling), education, and national scale media and community mobilization. Strengthen the capacity of health care providers to deliver quality maternal, infant, young children, and adolescent health and nutrition services at health facility and community levels. Revitalize growth monitoring, promotion and education, including routine screening, early case detection, referral, treatment, and follow-up of cases at all levels. Increase coverage of management of acute malnutrition by establishing a MUAC cut-off point which includes most of the wasted children and early detection of malnourished children. Strengthen the capacity of the health workforce and community volunteers for effective programming and delivery of quality services to prevent and treat all forms of malnutrition. Enforce legal mechanisms to guide the delivery of nutrition services and support improvement in nutrition status.

02

Morbidity, Vaccination, and supplementation for children 0-59 months

Address the causes of diarrhoea and acute respiratory infections among children through robust education to families to inform of the importance of health-seeking immediately when the children get sick as well as promote access to maternal, newborn and child health services. Maintain immunization coverage to protect children from vaccine preventable diseases and invest more efforts to reach the unreached population. Intensify prevention and control of micronutrient deficiencies by strengthening and promoting access to quality services for micronutrient supplementation for children under five, especially the multiple micronutrient powders (MNP) for children 6-23 months.

03

Infant and young child feeding for children 0-23 months

Invest in support for early breastfeeding initiation (within 1 hour after delivery) by increasing health workers' capacity to provide quality services, including counselling during antenatal care (ANC). Continue to promote exclusive breastfeeding for infants 0-6 months at facility,

community and household levels with continued breastfeeding and appropriate complementary feeding of children aged 6 to 23 months and beyond, and optimal feeding during illness while focusing on improving dietary diversity, improving coverage of micronutrient supplementation and food fortification programs. Expand counselling and education for a healthy diet at antenatal care (ANC), postnatal, growth monitoring visits, and other outreach services by integrating SBCC as an essential component to support families to improve household food consumption and quality of child diet. The critical messages for caretakers of children should include the importance of a healthy diet and physical activity promotion in national nutrition strategy to tackle the emerging overweight and obesity. In addition, incorporate obesity prevention in the school nutrition program.

04

Health and nutrition status of women of reproductive age (15-49 years)

Promote women's nutrition before, during, and after pregnancy. Address malnutrition in women before they become pregnant by implementing universal micronutrient supplementation for all pregnant women and adolescent girls through schools and community platforms for out-of-school adolescents. Strengthen school nutrition to ensure that the school is a healthy environment free from advertisements and access to unhealthy foods while guaranteeing access to nutritious foods and clean water. Set up a targeted supplementary feeding program for pregnant and lactating women of reproductive age based on MUAC criteria.

05

Wealth index

Continue advocacy on intensifying the implementation of poverty reduction strategies to address the disparities and malnutrition—advocate for scaleup of cash-based transfer linking it to nutrition outcomes. Focus on poor wealth quintiles and poor households on nutrition education because children in those households are at higher risk of malnutrition.

06

Food Security

Promote and support domestic household food production to improve food availability. Advocate for expansion of nutrition sensitive interventions such as cash transfers for poor households with pregnant and lactating women and children under 2 years of age to increase household purchasing power and hence access to nutritious foods. Ensure the access to food is complemented with the right knowledge of caretakers on dietary diversity and appropriate feeding practices.

07

Water sanitation and hygiene

Continue to implement the flagship intervention of community-led total sanitation (CLTS) and support the communities to adopt “the open defecation free” (ODF) status. Scale up the promotion of hygiene and sanitation practices at the health facilities, schools, community and household levels including communication with integrated messages on handwashing with soap and water at critical times, keeping a clean environment for handling food, use safe water, promote a hygienic toilet, safely remove and treat fecal waste, stop open defecation, and access to sanitation.

08

Address the determinant of stunting

First, invest in understanding the drivers of poor nutrition in children and women and tailor a response that significantly reduces child stunting. Second, strengthen the inter-ministerial/ inter-sectoral collaboration and coordination to implement critical nutrition-sensitive activities in preventing stunting effectively. Third, define the roles and responsibilities of each sector in reducing child stunting and, importantly, co-locate the interventions of all sectors. In all instances, national strategies must prioritize the most vulnerable children: the youngest, the poorest, and the socially excluded. Finally, measure the performance of national systems in delivering essential interventions to prevent stunting and tracking investments and expenditures against costed plans to ensure public accountability and indicate good governance.

Results Summary

Table 1. Summary of results, TLFNS 2020

INDICATOR	% (95% C.I.)	
Nutritional status of children 0-59 months (WHO 2006 standards)		
Acute malnutrition based on WHZ	Severe	1.5 (1.2-1.7)
	Moderate	7.1 (6.7-7.6)
	Global	8.6 (8.1-9.1)
	Overweight	1.2 (1.0-1.5)
Acute malnutrition based on MUAC	Severe	1.2 (1.0-1.4)
	Moderate	3.5 (3.2-3.9)
	Total	4.7 (4.3-5.1)
Stunting based on HAZ	Severe	16.9 (16.2-17.6)
	Moderate	30.2 (29.4-31.1)
	Total	47.1 (46.2-48.0)
Underweight based on WAZ	Severe	7.6 (7.1-8.1)
	Moderate	24.8 (24.0-25.5)
	Total	32.4 (31.5-33.2)
Morbidity (0-59 months)		
Illness in the last 2 weeks		
Diarrhoea	15.2 (14.5-15.8)	
Acute respiratory infection	9.9 (9.3-10.4)	
Fever (without cough)	23.5 (22.8-24.3)	
Treatment for illness		
Private clinic	3.3 (2.6-3.8)	
Public health facilities/hospital	94.9 (94.1-95.6)	
Religious leader	0	
Traditional healer	0	
Pharmacy	0.3 (0.0-0.5)	
Home treatment	1.4 (1.1-1.7)	
Other	0.2 (0.0-0.3)	
Immunisation, vaccination and supplementation (6-59 months)		
Measles vaccination-2 doses (18-59 months), confirmed by card or recall	60.3 (59.2-61.4)	
Measles vaccination-2 doses (18-59 months), confirmed by card	86.3 (83.5-89.2)	
Vitamin A supplementation (6-59 months), confirmed by card or recall	77.8 (76.9-78.5)	
Deworming (12-59 months), confirmed by card or recall	71.4 (70.5-72.4)	
Micronutrient powder (6-23 months), confirmed by card or recall	18.1 (16.9-19.3)	
Infant and young child feeding (0-23 months)		
Early initiation of breastfeeding (0-23 months)	46.8 (45.2-48.4)	
Exclusive breastfeeding (0-5 months)	64.2 (61.4-67.0)	
Bottle feeding (0-23 months)	32.1 (30.7-33.4)	
Continued breastfeeding at 1 year (12-15 months)	68.4 (64.9-72.0)	
Continued breastfeeding at 2 years (20-23 months)	29.2 (24.9-33.6)	
Introduced to solid foods at 6 months (6-8 months)	75.8 (72.5-79.0)	

Minimum meal frequency (6-23 months)		52.3 (50.7-53.9)
Minimum dietary diversity (6-23 months)		35.3 (33.8-36.8)
Minimum acceptable diet (6-23 months)		14.3 (13.2-15.4)
Milk feeding frequency for non-breastfed children (6-23 months)		29.3 (24.2-34.5)
Women of reproductive age (15-49 years)		
BMI for non-pregnant women (kg/m ²)		
Underweight (<18.5)		18.8 (18.1-19.5)
Normal (18.5-24.9)		61.9 (61.0-62.7)
Overweight (>=25.0)		19.3 (18.6-20.0)
Short stature (<145cm)		12.6 (12.1-13.2)
Acute malnutrition based on MUAC (mm)		
<210mm (low)	All	9.4 (8.9-9.9)
	Pregnant/Lactating	8.9 (8.2-9.8)
210-299mm (at risk)	All	21.9 (21.2-22.6)
	Pregnant/Lactating	23.2 (22.0-24.4)
Antenatal care provider		
Midwife		72.0 (70.9-73.2)
Medical doctor		21.6 (20.6-22.7)
Nurse		5.4 (4.8-5.9)
Nurse assistant		0.2 (0.1-0.3)
Traditional birth attendant		0.2 (0.1-0.3)
Other		0.3 (0.1-0.4)
Number of antenatal care visits		
3 or less		16.8 (15.9-17.8)
4 to 7		64.1 (62.9-65.4)
8 or more		19.0 (18.0-20.0)
Minimum dietary diversity for women (MDD-W)		
Good (>=5 groups)		65.4 (64.6-66.2)
Poor (0-4 groups)		34.6 (33.8-35.4)
Household food security		
Food consumption score (FCS)		
Poor (0-28)		35.2 (34.2-35.9)
Borderline (>28-42)		29.9 (29.2-30.7)
Acceptable (>42)		34.8 (34.0-35.6)
Food Insecurity Experience Scale (FIES)		
Food secure/mild food insecure (<4)		49.6 (48.7-50.5)
Moderate food insecure (4-6)		34.8 (33.9-35.6)
Severe food insecure (7-8)		15.6 (15.0-16.2)

Water, sanitation and hygiene (WASH)	
Access to water and sanitation	
Access to improved drinking water source	87.8 (87.2-88.3)
Access to improved sanitation facility	68.2 (67.4-69.0)
Access to improved excreta disposal facility	52.2 (51.4-53.1)
Hand washing method	
Water only	11.6 (11.0-12.1)
Water and ash	0.0
Water and sand	0.0
Water and soap	87.1 (86.5-87.7)
Other	1.3 (1.1-1.5)
Hand washing times	
Before cooking food	45.1 (44.3-46.0)
After defecation	28.5 (27.8-29.3)
Before eating food	80.0 (79.3-80.7)
After disposing child's faeces	6.1 (5.6-6.5)
Before feeding/breastfeeding children	6.2 (5.8-6.6)

01

Introduction

Introduction

1.1 General background

Timor-Leste is a country in South-East Asia which comprises the eastern half of the island of Timor, the nearby islands of Atauro and Jaco, and Oe-cusse, an enclave on the north western side of the island surrounded by Indonesian West Timor. Australia is the country's southern neighbour, separated by the Timor Sea. The country's size is about 5,794 square miles. The country is divided into thirteen municipalities, which in turn are sub-divided into 65 administrative posts, 442 sucos and 2,225 aldeias¹.

With over 70% of the population living in rural areas, Timor-Leste is an agrarian society which has adapted to the tropical climate of wet (i.e., November to May depending on elevation and geography) and dry seasons. Agriculture on the island has not reached its full productive potential. Only 30% of arable land is in use for crops or grazing. Due to chronic underproduction the food supply must be supplemented with imported cereals. Higher elevations (over nine months in the high cold zone) and the moist zone of the south coast tend to receive greater rainfall (as much 2000 mm per year and ~1500 mm over 7-8 months, respectively), while the northern coast is hotter and drier. The mountainous and steep terrain is predisposed to extensive soil erosion on the slopes. Climate change is expected to intensify wind and rainfall, increasing erosion from steep, deforested hillsides and affect agricultural productivity. Along with climate change, population growth will exert further pressure on the agricultural system, potentially exacerbating food insecurity if cropping systems and varieties do not improve².

1.2 Nutrition context

Childhood stunting is one of the most significant impediments to human development, globally affecting approximately 162 million children under the age of 5 years. Stunting, or being too short for one's age, is defined as a height that is more than two standard deviations below the World Health Organization (WHO) Child Growth Standards median. It is a largely irreversible outcome of inadequate nutrition and repeated bouts of infection during the first 1,000 days of a child's life. Stunting has long-term effects on individuals and societies, including diminished cognitive and physical development, reduced productive capacity and poor health, and an increased risk of degenerative diseases such as diabetes. If current trends continue, projections indicate that 127 million children under 5 years will be stunted in 2025. Therefore, further investment and action are necessary to the 2025 WHA target of reducing that number to 100 million. Stunting is a well-established risk marker of poor child development. Stunting before the age of 2 years predicts poorer cognitive and educational outcomes in later childhood and adolescence and has significant educational and economic consequences at the individual, household and community levels³.

Despite having decreased from 58% in 2010 to 50% in 2013, according to the Global Health Index (2017), Timor-Leste has the third highest prevalence of stunting and is among the only 3 countries in which at least half of children below 5 years are stunted⁴. According to the Fill the Nutrient Gap (FNG) report⁵, all Timorese households were able to afford to meet their energy needs but a nutritious diet that met the requirements of energy, protein and 13 micronutrients, would be unaffordable for most households. Diets modelled to meet the needs of energy, protein and 13 micronutrients cost \$158 to \$211 per month for five people, which was significantly higher than the minimum wage of \$115 per month.

1.3. Justification

The last national Timor-Leste Food and Nutrition Survey (TLFNS) was conducted in 2013. The findings revealed that there was an improvement in the nutritional status of children compared to the Timor-Leste Demographic and Health Survey conducted in 2010 (TLDHS 2010). There was a decrease of 8 percentage points in terms of stunting, 7 points in terms of underweight, and 8 points in terms of wasting. Given that there is a National Nutrition Strategy which covers the period 2014-2019, the TLFNS 2020 was expected to contribute to the evaluation of the impact of nutrition sensitive and nutrition specific programmes addressing nutrition throughout the life cycle.

5 WFP. Fill the Nutrient Gap Timor-Leste Report

1.4 Objectives

The overall objective of the survey was to determine the prevalence of malnutrition among children and women of reproductive age in Timor-Leste and to assess contributing factors at the household level, which include health-seeking behaviour, vaccination coverage, maternal, infant and young child feeding, household food security and water, sanitation and hygiene.

Specific objectives

Anthropometry

- To estimate the prevalence of Global and Severe Acute Malnutrition (GAM and SAM) among children aged 0 to 59 months (WHZ and MUAC)
- To estimate the prevalence of stunting among children aged 0-59 months
- To estimate the prevalence of underweight among children aged 0-59 months

Immunization, Morbidity and Health Practices

- To determine the two-week period prevalence of diarrhoea, acute respiratory infection and fever among children aged 0-59 months
- To determine health care seeking behaviour amongst children who have been ill in the previous 2 weeks
- To estimate the coverage of measles immunisation for children 18-59 months
- To estimate coverage of Vitamin A supplementation in the last six months among children aged 6-59 months
- To estimate the coverage of deworming for children aged 12-59 months

Infant and Young Child Feeding Practices

- Early initiation of breastfeeding (0-23 months)
- Exclusive breastfeeding under 6 months (0-5months)
- Prevalence of bottle feeding (0-23 months)
- Introduction to solid, semi-solid and soft foods (6-8 months)
- Continued breastfeeding at 1 year (12-15 months)
- Continued breastfeeding at 2 years (20-23 months)
- Age-appropriate breastfeeding for children 6-23 months
- Minimum dietary diversity in children 6-23 months
- Minimum meal frequency in children 6-23 months
- Minimum acceptable diet for children 6-23 months of age
- Consumption of sugar sweetened beverages for children 6-23 months of age
- Consumption of tracer junk foods for children 6-23 months of age
- Consumption of no fruits or vegetables for children 6-23 months of age
- Receipt of IYCF counselling in the previous 6 months (0-23 months of age)

Women of reproductive age (15-49 years)

- To estimate the proportion of women accessing 4 or more and 8 or more ANC visits
- To estimate the proportion of women consuming iron/folic acid supplementation tablets during pregnancy
- To determine the prevalence of underweight, overweight and obesity
- To estimate the prevalence of short stature based on height measurement
- To determine the prevalence of acute malnutrition based on MUAC cut-offs
- To measure minimum dietary diversity for women (MDD-W)
- To estimate women's consumption of sugar sweetened beverages
- To estimate women's consumption of tracer junk foods
- To estimate women's' consumption of no fruits and vegetables

Household characteristics, food security and coping mechanisms

- To determine socio-economic status of households using wealth quintiles
- To estimate the Food Consumption Score (FCS) to determine the proportion of households with poor, borderline and acceptable food consumption
- To determine the prevalence of moderate or severe food insecurity in the population, based on the Food Insecurity Experience Scale (FIES)
- To assess the usage of iodized salt

Water Hygiene and Sanitation

- To determine the proportion of households using an improved drinking water source
- To determine the proportion of households using an improved sanitation facility
- To assess hand washing at household level
- To determine methods of disposal of children's faeces at household level

02

Methodology

02

Methodology

The survey was based on the SMART (Standardised Monitoring and Assessment for Relief and Transitions) methodology, which is standardised, simplified, cross-sectional field survey method which is widely used internationally for nutrition survey design and for the collection of quality nutrition data to produce timely results for decision-making.

2.1. Target population

The target population for the anthropometric part of the survey was all children between 0 and 59 months of age and women of the reproductive age (15-49 years of age), who are considered to be the most nutritionally vulnerable and important groups in terms of nutrition in the life cycle.

2.2. Study design

The survey was designed as a cross-sectional household survey using a two-stage cluster sampling with representativeness for each of the 13 municipalities, which were the survey domains. In addition, the survey sought to compare results in the urban and rural areas and between wealth quintiles, which was consistent with TLFNS 2013 and therefore ensured that the results could be compared. The survey domains with their population figures are presented in Table 2 below.

Table 2. Timor-Leste 2018 projected population by municipality

Municipality	Population
Aileu	53,009
Ainaro	64,922
Baucau	126,236
Bobonaro	99,823
Covalima	68,185
Dili	316,728
Ermera	134,069
Lautem	66,845
Liquica	77,328
Manatuto	48,559
Manufahi	56,306
Oe-cusse	71,132
Viqueque	78,265
Timor-Leste	1,261,407

2.3. Sampling

2.3.1 Sampling method

The 2-stage cluster sampling method was used given that the survey was conducted over a large geographical area in which it was expected that there will not be a linear arrangement of households.

2.3.2 Sampling procedure: definition and selection of clusters

The primary sampling unit was the cluster. Clusters were selected from a list of aldeias using sampling with probability proportional to size (PPS). The list of aldeias in each municipality was listed. The required number of clusters were then selected using sampling with probability proportional to size (PPS). The list of clusters is shown in Annex 1.

2.3.3 Selection of households

The required number of households in each cluster were selected using systematic random sampling from a random starting point, which will follow the following steps:

- Identify the boundaries of the cluster and locate the centre
- Divide the number of households in the cluster by the required number of households to calculate a sampling interval
- Spin a pen to select a random direction
- Move in the direction of the pen, counting households, from 1 up to the number of the interval
- Interview the first household immediately at the end of the interval
- Select a new random direction and repeat the steps above

2.3.4 Special Cases

Absent household/respondents

In the event that either the whole household, or a respondent (for example, a child) was not present at the time of the survey, the team sought information from neighbours so as to confirm if the respondent/household would return the same day. If the household/respondent was expected back the same day, the team returned to the household to administer the questionnaire. If the household was not expected back the same day, the household was classified as an abandoned household and replaced randomly using the sampling method outlined above. Respondents who could not return the same day were recorded as absent.

Abandoned house

These were defined as either empty household, in which the residents had left permanently, or absent households which were not expected back the same day. These were replaced as described above.

Households without children and/or without women of reproductive age

These households were interviewed for the household module only.

Disabled children/women

They were included in the survey. In the event that a physical deformity prevented the measurement of child's or woman's anthropometric measurements (weight, height or MUAC), the data was recorded as missing in the questionnaire and on the relevant forms.

2.4 Sample size

The survey sample size was calculated automatically in ENA for SMART software, January 11, 2020 version using the assumptions shown in Table 3. The estimated prevalence was obtained from the Timor-Leste Food and Nutrition Survey 2013 (TLFNS 2013). The desired precision and design effect were based on the guidance in the SMART Methodology Manual 2.0 (2017). The proportion of children below 5 years and average household size were obtained from population projections. Based on previous surveys, the expected proportion of non-response was set at 10%.

Table 3. Sample size calculation in each municipality, TLFNS 2020

Parameters for Anthropometry	Value
Estimated Prevalence of Stunting	50%
± Desired precision	5%
Design Effect	1.5
Children to be included- 6 to 59 months	627
Children to be included- 0 to 59 months	696
Average HH Size	5
Percentage Children under-5	15.8%
Percentage Non-response Households	10%
Households to be included	980

The fixed household method was used, implying that the target was the number of households rather than the number of children, based on the assumption that 980 households would result in at least **627 children 6-59 months** (this translates to **696 children 0-59 months** as ENA-for-SMART determines the number between 6 and 59 months, which is assumed to be 90% of the total 0-59 months) being interviewed. In each municipality, there were a total of **80 clusters, 48 of which had 12 households, while 32 had 13 households each, bringing the total target to 992 households per municipality and 12,896 overall.**

2.5 Case definitions and inclusion criteria

Household	A household was defined as a group of people who normally live together and eat from the same pot and resources.
Sex of children	Sex was recorded as male or female.
Birth date or age in months for children 0-59 months	The exact date of birth (day, month, and year) was recorded from birth certificates or LISIO (maternal and child booklet). In the absence of the official document, the date of birth was obtained from recall. A local calendar of events was used to support recall. In the event that the day of birth was not known, 15 was entered ⁶ .
Age of women 15-49 years	The reported age was recorded in years.
Weight of children 0-59 months	Measurements were taken to the nearest 0.1kg using an electronic scale.
Height/Length of children 0-59 months	Children's height or length was taken to the nearest 0.1cm using a height/length board. Children 2 years and above, who were measured standing up, while those below 2 years, who were measured lying down. For children below 2 years could not be measured lying down, an adjustment was automatically made by adding 0.7cm. For children 2 years and above could not be measured standing up, an automatic adjustment was made by subtracting 0.7cm.
Oedema in children 0-59 months	Bilateral oedema was assessed by applying gentle thumb pressure on to the tops of both feet of the child for a period of three seconds and thereafter observing for the presence or absence of an indent.
MUAC of children 0-59 months and women 15-49 years	MUAC was measured at the mid-point of the left upper arm between the elbow and the shoulder and taken to the nearest 0.1cm using a standard tape.
Measles vaccination in children 18-59 months	Measles vaccination was assessed by checking for the measles vaccine on the child health card if available or by asking the caregiver to recall if no LISIO booklet was available or if it was not recorded.
Vitamin A supplementation in last 6 months in children 6-59 months	Whether the child received a vitamin A capsule over the past six months was recorded using recall from the mother/caregiver.
Deworming-children 12-59 months	Whether the child received deworming was recorded using recall from the mother/caregiver.
Morbidity	Retrospective morbidity was assessed using recall for the past 2 weeks.
Diarrhoea	Diarrhoea was defined as three loose stools or more in 24 hours. Caregivers were asked if their child had suffered episodes of diarrhoea in the past two weeks.
Fever (without cough)	Fever was assessed through a two-week recall, defined as fever in the absence of respiratory symptoms (cough) in children 6-59 months. This indicator is a proxy for suspected malaria.

Acute Respiratory Infection (ARI)	Cough, breathing difficulties, chest in-drawing, rapid breathing.
ANC enrolment and iron and folic acid pills coverage	If the surveyed woman was pregnant, she was assessed on whether she was enrolled in the ANC programme and was receiving iron-folic acid pills.
Classification of malnutrition	Table 4 shows the definition and classification of the nutritional indicators used. Main results are reported according the World Health Organisation (WHO) Growth Standards 2006.

Table 4. Classification of malnutrition using WHO 2006 Growth Standards

Indicator		Definitive criteria
Acute Malnutrition	Global Acute Malnutrition	WHZ <-2SD and/or Presence of Bilateral pitting oedema- MUAC <125mm
	Moderate Acute Malnutrition	WHZ <-2 and ≥-3 MUAC ≥115mm and <125mm
	Severe Acute Malnutrition	WHZ <-3 and/or oedema MUAC <115mm
Stunting	Overall stunting	HAZ <-2
	Moderate Stunting	HAZ <-2 and ≥-3
	Severe stunting	HAZ <-3
Underweight	Overall Underweight	WAZ <-2
	Moderate Underweight	WAZ <-2 and ≥-3
	Severe Underweight	WAZ <-3

Table 5. Classification of public health significance for children under 5 years of age⁷

Prevalence %	Very High	High	Medium	Low	Very low
Wasting	≥15	10-<15	5-<10	2.5-<5	<2.5
Stunting	≥30	20-<30	10-<20	2.5-<10	<2.5

6 WHO/UNICEF. Recommendations for data collection, analysis and reporting on anthropometric indicators in children under 5 years old.

7 UNICEF/WHO/World Bank. Levels and trends in child malnutrition-Joint Malnutrition Estimates.

Infant and young child feeding indicators⁸

Early initiation of breastfeeding	Definition	Percentage of newborns put to the breast within one hour of birth.
	Formula	$\frac{\text{Children born in the last 2 years who were put to the breast within one hour of birth}}{\text{Children born in the last 2 years}}$
Exclusive breastfeeding	Definition	Proportion of infants 0–5 months of age who are fed exclusively with breast milk.
	Formula	$\frac{\text{Infants 0–5 months of age who received only breast milk during the previous day}}{\text{Infants 0–5 months of age}}$
Continued breastfeeding at 1 year	Definition	Proportion of children 12–15 months of age who are fed breast milk.
	Formula	$\frac{\text{Children 12–15 months of age who received breast milk during the previous day}}{\text{Children 12–15 months of age}}$
Continued breastfeeding at 2 years	Definition	Proportion of children 20-23 months of age who are fed breast milk.
	Formula	$\frac{\text{Children 20-23 months of age who received breast milk during the previous day}}{\text{Children 20-23 months of age}}$
Introduction of solid, semi-solid or soft foods	Definition	Proportion of infants 6–8 months of age who receive solid, semi-solid or soft foods.
	Formula	$\frac{\text{Infants 6–8 months of age who received solid, semi-solid or soft foods during the previous day}}{\text{Infants 6–8 months of age}}$
Minimum dietary diversity (MDD)	Definition	Percentage of children 6-23 months of age who received a minimum diet diversity.
	Formula	$\frac{\text{Number of children 6-23 months of age who received foods from } \geq 5 \text{ (out of 8) food groups}^1 \text{ during the previous day.}}{\text{Children 6-23 months of age}}$
<p><i>(The eight food groups are: (i) breastmilk; (ii) grains, roots and tubers; (iii) legumes and nuts; (iv) dairy products (infant formula, milk, yogurt, cheese); (v) flesh foods (meat, fish, poultry and liver/organ meats); (vi) eggs; (vii) vitamin-A rich fruits and vegetables; (viii) other fruits and vegetables.)</i></p>		

⁸ WHO. Indicators for assessing infant and young child feeding practices. Part II. Measurement.

Minimum meal frequency (MMF)	Definition	Percentage of children 6-23 months of age who received a minimum meal frequency.
	Formula	$\frac{\text{Number of breastfed children 6-23 months of age who received solid, semi-solid or soft foods the minimum number of times or more during the previous day AND the number of non-breastfed children 6-23 months of age who received solid, semi-solid or soft foods or milk feeds the minimum number of times or more during the previous day}}{\text{Breastfed children aged 6-23 months AND Non-breastfed children aged 6-23 months}}$
		<p>* Minimum is defined as: 2 times solid, semi-solid or soft foods for breastfed infants 6-8 months of age; 3 times solid, semi-solid or soft foods for breastfed children 9-23 months of age; and 4 times solid, semi-solid or soft foods and/or milk feeds for non-breastfed children 6-23 months of age</p> <p>* Milk feeds refer to infant formula, animal milk (tinned/powdered/fresh) and yogurt</p>
Minimum acceptable diet (MAD)	Definition	Percentage of children 6-23 months of age who received a minimum acceptable diet
	Formula	$\frac{\text{Breastfed children 6-23 months of age who had at least the minimum dietary diversity and the minimum meal frequency during the previous day AND Non-breastfed children 6-23 months of age who received at least two milk feedings and had at least the minimum dietary diversity not including milk feeds and the minimum meal frequency during the previous day}}{\text{Breastfed children aged 6-23 months AND Non-breastfed children aged 6-23 months}}$
Bottle feeding	Definition	Proportion of children 0-23 months of age who are fed with a bottle.
	Formula	$\frac{\text{Children 0-23 months of age who were fed with a bottle during the previous day}}{\text{Children 0-23 months of age}}$
Age-appropriate breast-feeding	Definition	Proportion of children 0-23 months of age who are appropriately breastfed.
	Formula	$\frac{\text{Infants 0-5 months of age who received only breast milk during the previous day}}{\text{Infants 0-5 months of age}}$ <p style="text-align: center;">AND</p> $\frac{\text{Children 6-23 months of age who received breast milk, as well as solid, semi-solid or soft foods, during the previous day}}{\text{Children 6-23 months of age}}$
Milk feeding frequency for non-breastfed children	Definition	Proportion of non-breastfed children 6-23 months of age who receive at least 2 milk feedings.
	Formula	$\frac{\text{Non-breastfed children 6-23 months of age who received at least 2 milk feedings during the previous day}}{\text{Non-breastfed children 6-23 months of age}}$

Anthropometry for women of reproductive age

Table 6. Classification of malnutrition using Body Mass Index (BMI)⁹

Classification	BMI (kg/m ²)
Underweight	<18.5
Normal	18.5-24.99
Overweight	> 25-29.99
Obese	> 30

Table 7. Classification of malnutrition using Mid Upper Arm Circumference (MUAC)

Classification	MUAC (cm)
Low	<21
At-risk	21-22.9
Normal	>= 23

Table 8. Classification of low stature

Classification	Height (cm)
Short Stature	<145cm
Normal stature	>=145cm

Minimum dietary diversity for women (MDD-W)

MDD-W is a dichotomous indicator of whether or not women 15–49 years of age have consumed at least five out of ten defined food groups the previous day or night. The 10 groups are:

1. Grains, white roots and tubers, and plantains;
2. Pulses (beans, peas and lentils);
3. Nuts and seeds;
4. Dairy products;
5. Meat, poultry and fish;
6. Eggs;
7. Dark green leafy vegetables;
8. Other vitamin A-rich fruits and vegetables;
9. Other vegetables;
10. Other fruits.

Table 9. Minimum dietary diversity for women (MDD-W)¹⁰

MDD-W	Threshold
Good	>=5 food groups
Poor	0-4 food groups

⁹ WHO. Obesity-Preventing and Managing the global epidemic. WHO Technical Report Series 894.

¹⁰ FAO/FANTA/USAID. Minimum Dietary Diversity for Women-A Guide to Measurement.

Food Consumption Score (FCS)¹¹

The frequency weighted diet diversity score or “Food consumption score” is a score calculated using the frequency of consumption of different food groups consumed by a household/individual during the 7 days before the survey (Table 10).

Table 10. Food Consumption Score (FCS)

#	Food items (examples)	Food group	Weight
1	Maize, maize porridge, rice, sorghum, millet pasta, bread and other cereals	Cereals and tubers	2
2	Cassava, potatoes and sweet potatoes		
3	Beans, peas, groundnuts and cashew nuts	Pulses	3
4	Vegetables and leaves	Vegetables	1
5	Fruits	Fruit	1
6	Beef, goat, poultry, pork, eggs and fish	Meat and fish	4
7	Milk, yogurt and other dairy	Milk	4
8	Sugar and sugar products	Sugar	0.5
9	Oils, fats and butte	Oil	0.5
10	Condiments	Condiments	0
FCS	Classification		
<=28	Poor consumption		
>28 and <=42	Borderline consumption		
>42	Acceptable consumption		

Food Insecurity Experience Scale (FIES)¹²

The FIES consists of a set of eight short yes/no questions which focus on self-reported, food-related behaviours and experiences associated with increasing difficulties in accessing food due to resource constraints. The measure of food insecurity associated with a respondent can be located on the scale based on the number of positive responses to the questions. Such measures are then used to classify respondents into categories of food insecurity severity. The questions are shown below.

Table 11. FIES questions

During the last 12 months...
Were worried you would run out of food because of a lack of money or other resources?
Were unable to eat healthy and nutritious food because of a lack of money or other resources? 3 (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)
Ate only a few kinds of foods because of a lack of money or other resources?
Had to skip a meal because there was not enough money or other resources to get food?
Ate less than you thought you should because of a lack of money or other resources?
Ran out of food because of a lack of money or other resources?
Were hungry but did not eat because there was not enough money or other resources for food?
Went without eating for a whole day because of a lack of money or other resources?

¹¹ WFP/FAO. Interagency Workshop Report Measures of Food Consumption - Harmonizing Methodologies Rome, 9 - 10 April 2008

¹² <http://www.fao.org/3/a-bl404e.pdf>

Each positive response carries a score of 1. The categories for analysis based on the responses are shown below¹³:

Table 12. FIES classification

Raw score	Classification
<4	Food secure/Mild food insecure
4-6	Moderate food insecure
7-8	Severe food insecure

Wealth index¹⁴

Wealth is the value of all natural, physical and financial assets owned by a household, reduced by its liabilities. Household wealth is a measure commonly used in food security assessments. It gives an idea of households' ability to access food, the severity of food insecurity and gives information about the economic situation of the food insecure. It is used to differentiate between the poorer and the wealthier households in food security related indicators, such as food consumption, and thereby provides information on how to target the food insecure. The wealth index is commonly used in reports and analysis based on datasets from Demographic and Health Surveys (DHS), Multiple Indicator Cluster Surveys (MICS), and WFP surveys, and is used to rank households into quintiles. The value of using the wealth index is especially recognised in contexts where reliable income and expenditure data is absent. Principal Component Analysis (PCA) is used to create the wealth index.

Water, sanitation and hygiene indicators

Table 13. Improved drinking water source definition

Improved sources	Unimproved sources
Public tap/standpipe	Unprotected well
Piped water into dwelling	Surface water
Tubewell/borehole	
Protected well/spring	
Bottled water	

Table 14. Improved sanitation facility and excreta disposal facility definition

	Improved facilities	Unimproved facilities
Sanitation facility	Flush latrine with septic tank	Pit latrine without slab
	Pit latrine with slab	Flush latrine without septic tank
		No latrine/bush
Improved excreta disposal facility	Improved facility + not shared	
Shared	Improved + shared by 2 families	
Unimproved	Unimproved facility OR shared by more than 2 families

¹⁴ WFP, VAM Guidance Paper-Creation of a wealth index

2.6 Questionnaire

The survey questionnaire included 3 modules, which were as follows:

- Child module (0-59 months): for child anthropometry, health and infant and young child feeding.
- Maternal module (15-49 years): for maternal nutritional status, dietary diversity and antenatal care.
- Household module: for the wealth index, household food security, dietary diversity, water, sanitation and hygiene.

2.7 Survey Personnel

The data collection team was made up of 64 members, who were in 16 teams, each with 4 members.

The team member roles were as follows:

- Measurer: responsible for reading all anthropometric measurements
- Assistant measurer: responsible for ensuring that the children/women are in the correct position and recording the measurement in the data form.
- Interviewer: responsible for completing the household listing form and administering the questionnaires and data entry into the tablet.
- Supervisor: responsible for ensuring that all procedures are followed for sampling, interviewing and data entry, and also responsible for sending completed and verified questionnaires to the server at the end of each day of data collection.

A list of the team members is shown in Annex 2.

2.8 Training

The trainings for the data collection teams were conducted over a period of 5 days each in Dili. Due to the large number, there were two separate trainings, each attended by 32 participants. The training included the following aspects:

- Introduction to nutrition surveys
- Sampling and household selection
- Anthropometry
- Questionnaire familiarisation
- Mobile data collection
- Field procedures
- Standardisation test

A complete agenda for the training is shown in Annex 3. Results of the standardisation test are contained in Annex 4.

2.9 Data collection and supervision

The 16 teams collected data over a period of 5 days in each of the 13 municipalities using android tablets which contained the 3 modules of the questionnaire. The 16 teams were supervised by a multi-agency team led by the Ministry of Health which ensured that data was collected with a high degree of quality.

2.10 Data entry, cleaning and analysis

At the end of each day of data collection, the supervisor in each team checked the accuracy and completeness of questionnaires before sending the completed questionnaires to a central ONA server using an internet connection. A plausibility report was generated on a daily basis for anthropometry so as to test the quality of the data. Feedback was given to the monitoring team as well as the data collection team. In some instances, measurements were re-taken. There were also situations whereby data entry errors were identified and corrected given that each measurement was recorded on forms before being entered into the tablets. Data analysis for anthropometry was performed using ENA-for-SMART. Analysis for the remaining modules was conducted using both SPSS (which was particularly used to generate the wealth quintiles as well as the regression analysis) and EPI-INFO.

03

Results

Results

3.1 Sample coverage and characteristics of respondents

From the target of 12,896 households, the total number completed was 12,881, which represents 99.9%. In terms of children below 5 years, a total of 11,246 were measured, against a target of 9,048, which was 124% (Table 15).

Table 15. Target and actual sample size by municipality, TLFNS 2020

Municipality	Households			Surveyed population	Average household size	Children below 5 years		
	Target	Actual	Percentage			Target	Actual	Percentage
Aileu	992	991	99.9%	5,837	5.9	696	875	126%
Ainaro	992	992	100.0%	5,935	6.0	696	916	132%
Baucau	992	991	99.9%	5,381	5.4	696	843	121%
Bobonaro	992	992	100.0%	5,978	6.0	696	787	113%
Covalima	992	992	100.0%	5,578	5.6	696	785	113%
Dili	992	983	99.1%	6,376	6.5	696	927	133%
Ermera	992	992	100.0%	5,884	5.9	696	931	134%
Lautem	992	992	100.0%	5,829	5.9	696	1,010	145%
Liquica	992	990	99.8%	5,628	5.7	696	842	121%
Manatuto	992	992	100.0%	5,459	5.5	696	842	121%
Manufahi	992	992	100.0%	5,576	5.6	696	822	118%
Oe-cusse	992	991	99.9%	5,159	5.2	696	683	98%
Viqueque	992	991	99.9%	5,417	5.5	696	983	141%
Total	12,896	12,881	99.9%	74,037	5.7	9,048	11,246	124%

The average household size was 5.7 for the sample. Most of the households (59.9%) had between 5 to 9 people, while a third (33.3%) had 1 to 4 people. Over 90% of households were male headed. Over three quarters (76.1%) was rural, which reflects the population statistics (Table 16).

w

Table 16. Description of households by sex and age of household head and residence, TLFNS 2020

Description	n/N	% (95% C.I.)
Household size		
1-4	4295/12881	33.3 (32.2-34.5)
5-9	7711/12881	59.9 (58.8-61.0)
10-14	815/12881	6.3 (5.8-6.9)
15-19	51/12881	0.4 (0.3-0.5)
20+	9/12881	0.1 (0.0-0.1)
Mean	5.7	(5.7-5.8)
Sex of household head		
Male	11808/12881	91.7 (91.2-92.2)
Female	1073/12881	8.3 (7.8-8.8)
Age of household head		
<18 years	2/12881	0.02 (0.00-0.04)
18 to 29 years	1589/12881	12.3 (11.7-13.0)
30 to 39 years	3959/12881	30.7 (29.8-31.6)
40 to 49 years	2911/12881	22.6 (21.9-23.3)
50 to 59 years	2270/12881	17.6 (17.0-18.3)
60+ years	2150/12881	16.7 (15.9-17.4)
Residence		
Rural	9800/12881	76.1 (73.6-78.5)
Urban	3081/12881	23.9 (21.5-26.4)

3.2 Children (0-59 months)

3.2.1 Anthropometric indicators (WHO 2006 standards)

Stunting refers to a child who is too short for his or her age. These children can suffer severe irreversible physical and cognitive damage that accompanies stunted growth. The devastating effects of stunting can last a lifetime and even affect the next generation. Wasting refers to a child who is too thin for his or her height. Wasting is the result of recent rapid weight loss or the failure to gain weight. A child who is moderately or severely wasted has an increased risk of death, but treatment is possible. Overweight refers to a child who is too heavy for his or her height. This form of malnutrition results from energy intakes from food and beverages that exceed children's energy requirements. Overweight increases the risk of diet-related non-communicable diseases later in life¹⁵.

The quality of anthropometric data met the required standard in terms of all the key quality parameters, which include the proportion of flagged values, sex ratio, age ratio, digit preference, standard deviation, skewness, kurtosis and poisson distribution (Table 17). In all municipalities, the standard deviation (SD) of weight-for-height z-score (WHZ) was below 1.1, which is a measure of good quality. Sex ratio was particularly high in Aileu, while the proportion of flagged values was highest in Dili, which was the first municipality for data collection.

Table 17. Plausibility report for anthropometry by municipality, TLFNS 2020

Municipality	Bias			Digit preference			Sample distribution				Overall quality	
	Flagged values	Sex ratio	Age ratio	Weight	Height	MUAC	SD of WHZ	Skewness WHZ	Kurtosis WHZ	Poisson dist. WHZ-2	Total	Quality level

Total	5389	100%	5857	100%	11246	100%	0.9

Figure 1. Trends in prevalence of malnutrition : 2010-2020

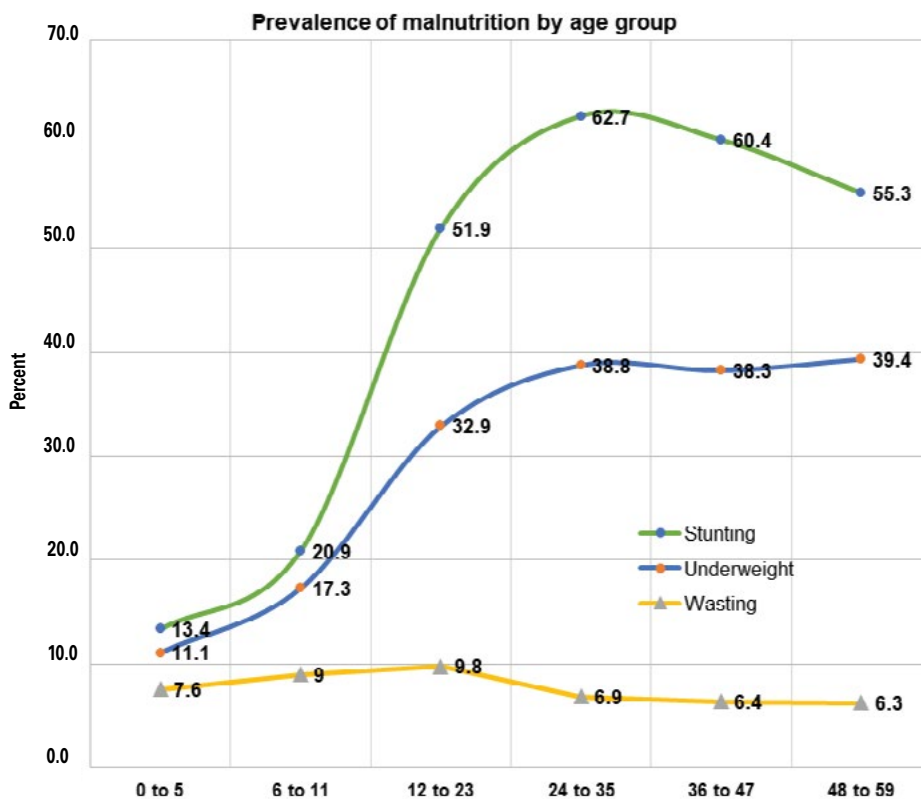

Figure 1 reveals that the trend of improvement in terms of nutritional status of children below 5 years continued, with a reduction in stunting, wasting, underweight as well as overweight (Figure 1). The decrease in the prevalence of stunting, wasting and underweight were all statistically significant ($p < 0.05$) when comparing 2020 with 2013. The decrease in overweight was not statistically significant.

Figure 2. Prevalence of malnutrition by wealth quintile

The prevalence of malnutrition increased with decreasing wealth quintile for stunting and underweight, but the reverse was true for wasting, mainly since wasting was high in Dili, the largest urban centre (Figure 2).

Figure 3. Prevalence of malnutrition by age group

The prevalence of acute malnutrition was highest in the 12-23 months age group. Stunting increased with age and peaked at the 24-35 months age group then began to decrease. Underweight peaked at the 24-35 months age group then was almost unchanged up to the 48-59 months age group (Figure 3).

The prevalence of global acute malnutrition (GAM) was 8.6% (8.1-9.1, 95% C.I), which falls within the medium category in terms of WHO classification. The GAM prevalence was higher in males (8.9%) than females (6.3%). GAM was highest in Oe-cusse (13.0%), Bobonaro (11.8%), and Dili (10.1%) and was higher in urban (8.9%) than rural areas (7.3%). The prevalence of GAM increased with decreasing maternal education status as well as decreasing wealth quintile (Table 19).

Table 19. Prevalence of acute malnutrition and overweight among children (aged 0–59 months) based on WHZ by sex, age group, municipality, residence, mother/caregiver’s education status and wealth quintile, TLFNS 2020

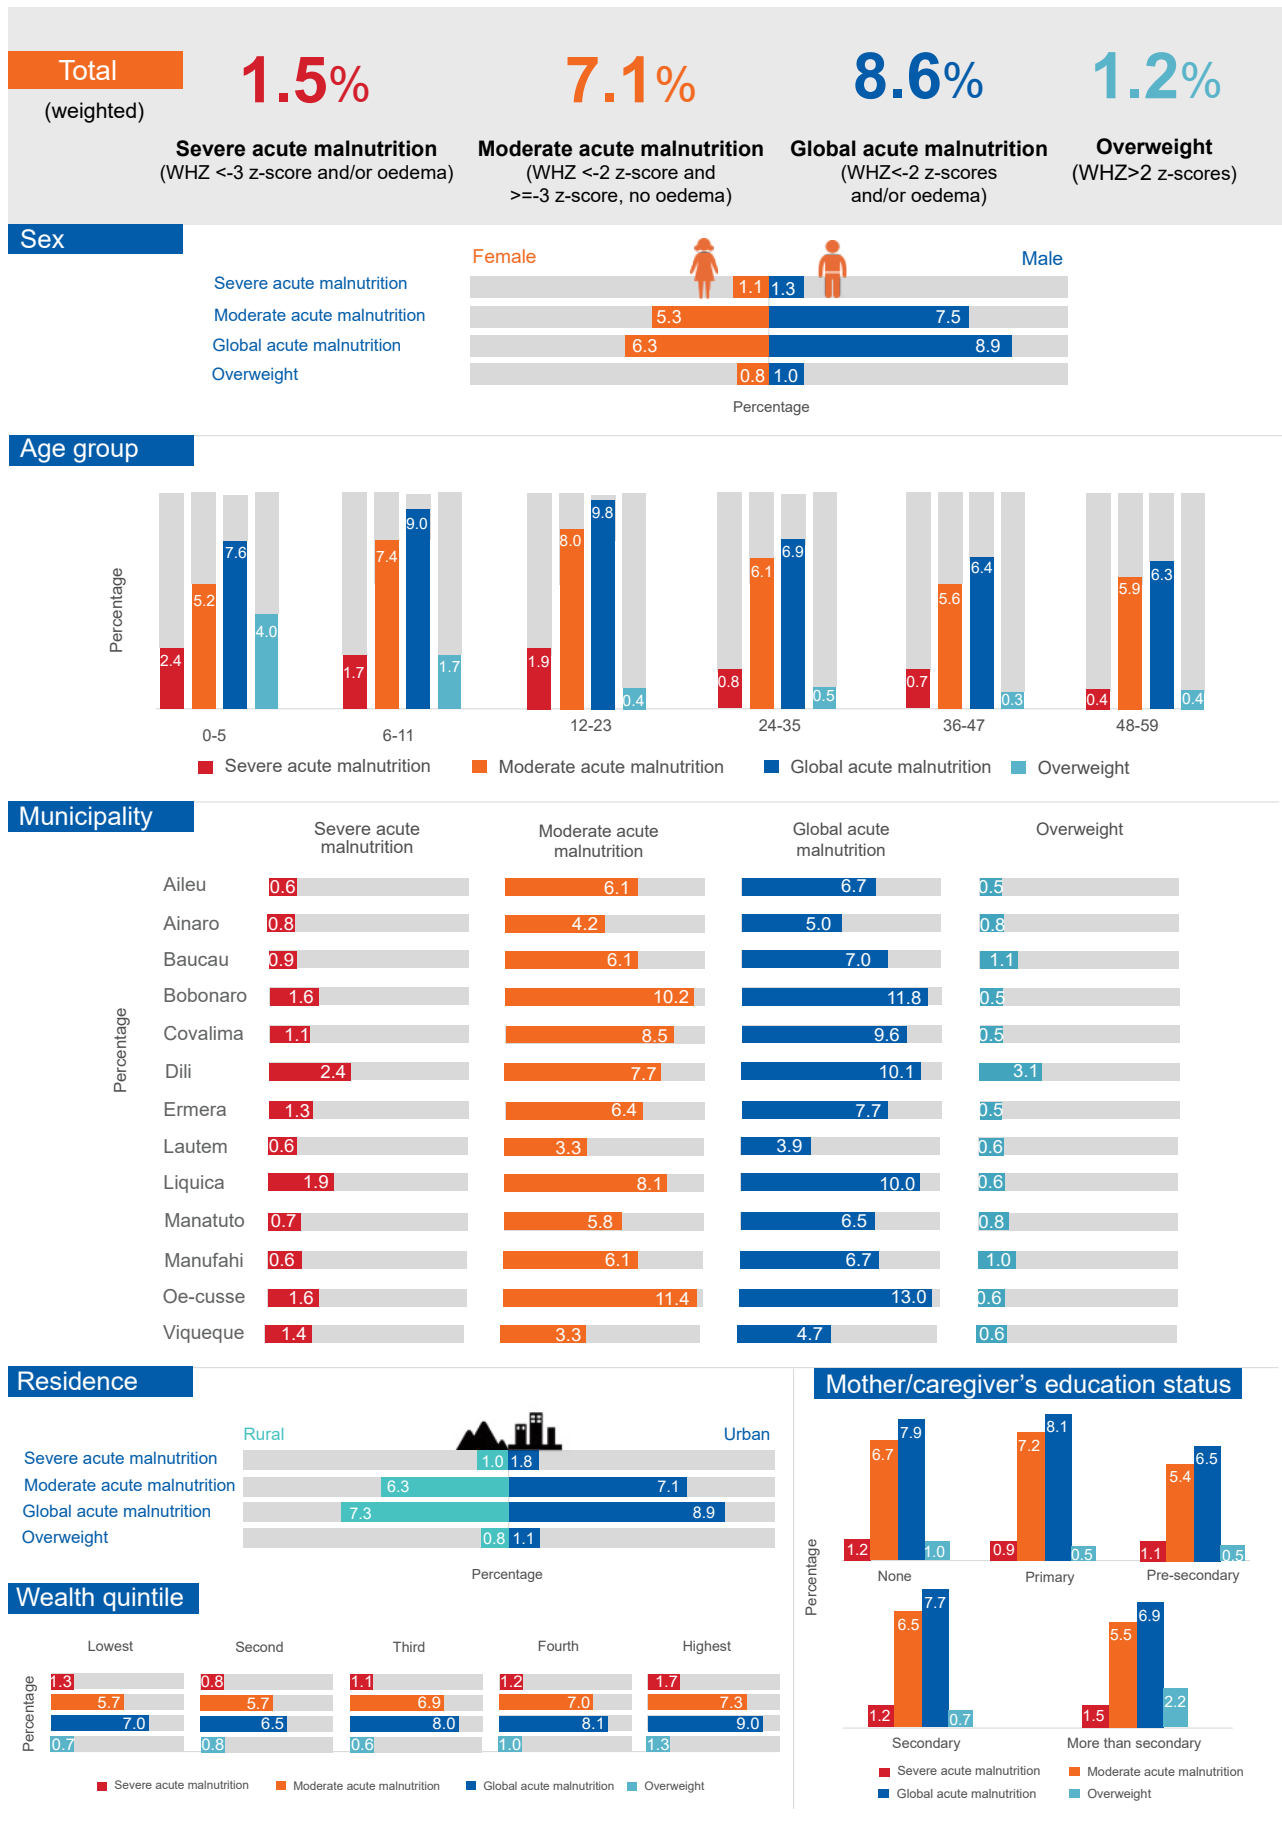

Figure 4. WHZ distribution

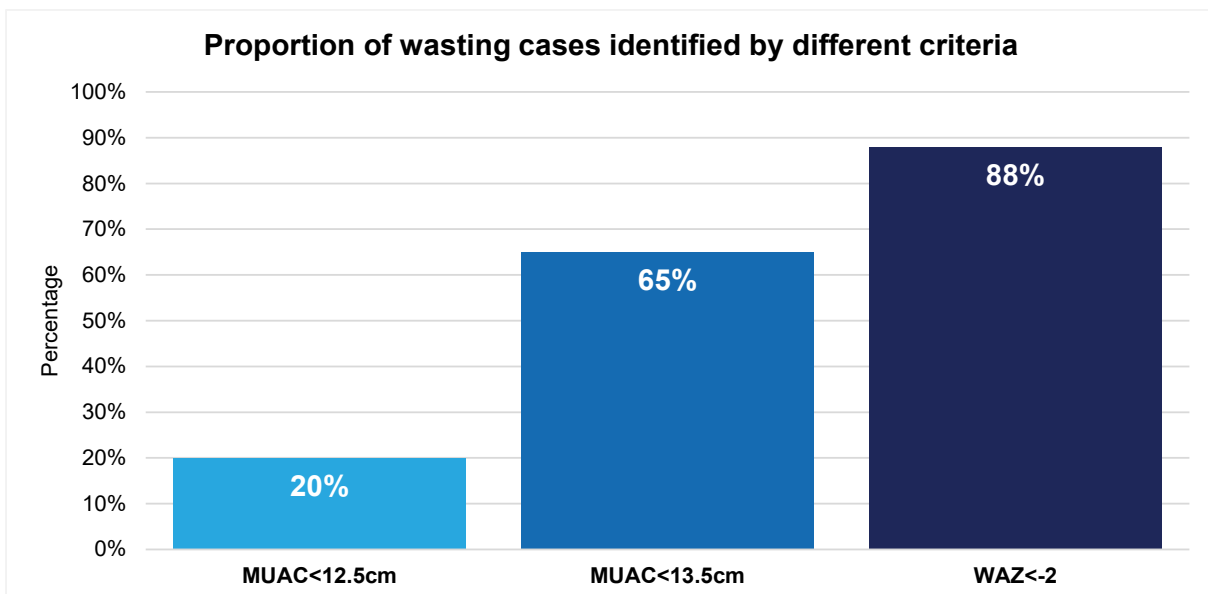

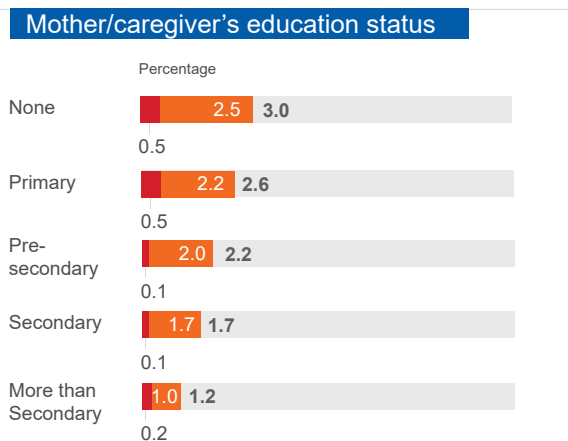

Figure 4 is a comparison of the survey and WHO distribution of weight-for-height z-scores. The survey curve was shifted to the left of the WHO curve, showing a higher prevalence of acute malnutrition than the reference population. The mean of WHZ was -0.64 ± 1.00 .

Figure 5. Proportion of wasting cases identified by different criteria

As Table 20 shows, based on MUAC, the prevalence of acute malnutrition for children 6-59 months was 2.7% (2.4-3.0, 95% C.I), which was much lower than the prevalence based on WHZ. As revealed by Figure 5, WAZ<-2% identified 88% of the wasting cases (WHZ<-2). However, MUAC<13.5cm identified 65%, while MUAC<12.5cm identified only 20%. This shows a very low overlap between MUAC and WHZ, which is an important finding given that case finding at community level uses MUAC, as it shows that the standard cut-off is inadequate in terms of capturing children with wasting.

Table 20. Prevalence of acute malnutrition based on MUAC cut-offs (and/or oedema) - 6-59m by sex, age group, municipality, residence, mother/caregiver's education status and wealth quintile, TLFNS 2020

■ Severe acute malnutrition ■ Moderate acute malnutrition

Table 21. Prevalence of stunting based on HAZ by sex, age group, municipality, residence, mother/caregiver's education status and wealth quintile, TLFNS 2020

The prevalence of stunting for Timor-Leste was 47.1% (46.2-48.0, 95% C.I), which is well above the WHO “very high” threshold of $\geq 30\%$. Stunting therefore continues to be a major problem in the country. Stunting was higher for boys (52.0%) than girls (46.6%), and much higher in rural areas (52.5%) than urban areas (39.8%). As observed in previous surveys, stunting was highest in Ermera (63.4%), Ainaro (60.3%) and Oe-cusse (57.1%). Children with mothers/caregivers with lower education status had a higher prevalence of stunting (Table 21).

Figure 6. HAZ distribution

The HAZ distribution of the survey is shown in Figure 6. The curve followed a normal distribution with a mean HAZ of -1.90 ± 1.28 . The graph showed some kurtosis.

Table 22. Prevalence of underweight based on WAZ by sex, age group, municipality, residence, mother/caregiver's education status and wealth quintile, TLFNS 2020

The prevalence of underweight in Timor-Leste was 32.4 (31.5-33.2, 95% C.I), with a higher prevalence among boys (34.2%) than girls (30.4%). Underweight was highest in Oe-cusse (43.2%) and Ermera (40.0%), and higher in rural areas (33.0%) than urban areas (30.4%). Children whose mothers/caregivers had a lower education status had a higher prevalence of underweight (Table 22).

Figure 7. WAZ distribution

The survey WAZ distribution followed a very similar shape to the standard WHO distribution, with a mean WAZ of -1.53 ± 1.05 (Figure 7).

Mean z-scores, design effects and excluded subjects are summarized by municipality in Table 23.

Table 23. Mean z-scores, Design Effects and excluded subjects based on WHO flags by municipality, TLFNS 2020

Municipality	Indicator	N	Mean z-scores ± SD	Design Effect (z-score < -2)	Z-scores not available	Z-scores Out of range

3.2.2 Morbidity

The proportion of children who reported having experienced diarrhoea was 15.2% (14.5-15.8, 95% C.I), with 9.9% (9.3-10.4, 95% C.I) for acute respiratory infection and 23.5% (22.8-24.3, 95% C.I) based on a 14-day recall period (Table 24). The TLFNS 2013 had similar findings for diarrhoea (16.7%).

Table 24. Prevalence of reported illness among children 0-59 months in the last 14 days by sex, age group, municipality, residence, mother/caregiver's education status and wealth quintile, TLFNS 2020

3.2.3 Vaccination and supplementation

The coverage of measles vaccination was 86.3% (83.5-89.2, 95% C.I), with 60.3% (59.2-61.4, 95% C.I) confirmed with the card (Table 25). The coverage of Vitamin A supplementation was 77.8% (76.9-78.5, 95% C.I) for the last 6 months. The proportion of children who received deworming was 71.4% (70.5-72.4, 95% C.I). The coverage of micronutrient powder supplementation was only 18.1% (16.9-19.3, 95% C.I).

Table 25. Measles vaccination Vitamin A supplementation, Deworming and micronutrient powder coverage age by sex, municipality, residence, mother/caregiver's education status and wealth quintile, TLFNS 2020

3.2.4 Infant and young child feeding

The proportion of children who were introduced to breast milk within an hour after birth was 46.8% (45.2-48.4, 95% C.I.). About a quarter 32.1% (30.7-33.4, 95% C.I) of children had been bottle fed. Bottle feeding was highest in Dili, and generally higher in urban than in rural municipalities (Table 26).

Table 26. Early initiation of breastfeeding and bottle feeding (0-23 months) by sex, municipality, residence, mother/caregiver's education and wealth quintile (TLFNS 2020)

64.2% (61.4-67.0, 95% C.I.) of children below 6 months had been exclusively breastfed (Table 27). The proportion of children who were still breastfeeding at 1 year (12-15 months) was 68.4% (64.9-72.0, 95% C.I.). However, only 29.2% (24.9-33.6, 95% C.I.) were still breastfeeding at 2 years (20-23 months). Exclusive breastfeeding was higher among females (70.7%) than males (66.5%), and urban areas (70.8%) than rural areas (60.8%) and was also lowest (56.8%) in the highest wealth quintile.

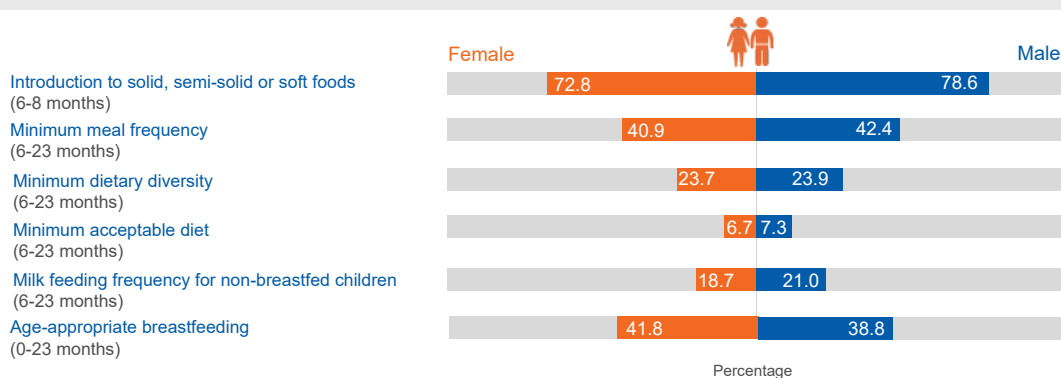

Table 27. Exclusive and continued breastfeeding indicators by sex, municipality, residence, mother/caregiver's education status and wealth quintile, TLFNS 2020

Mother/caregiver’s education status

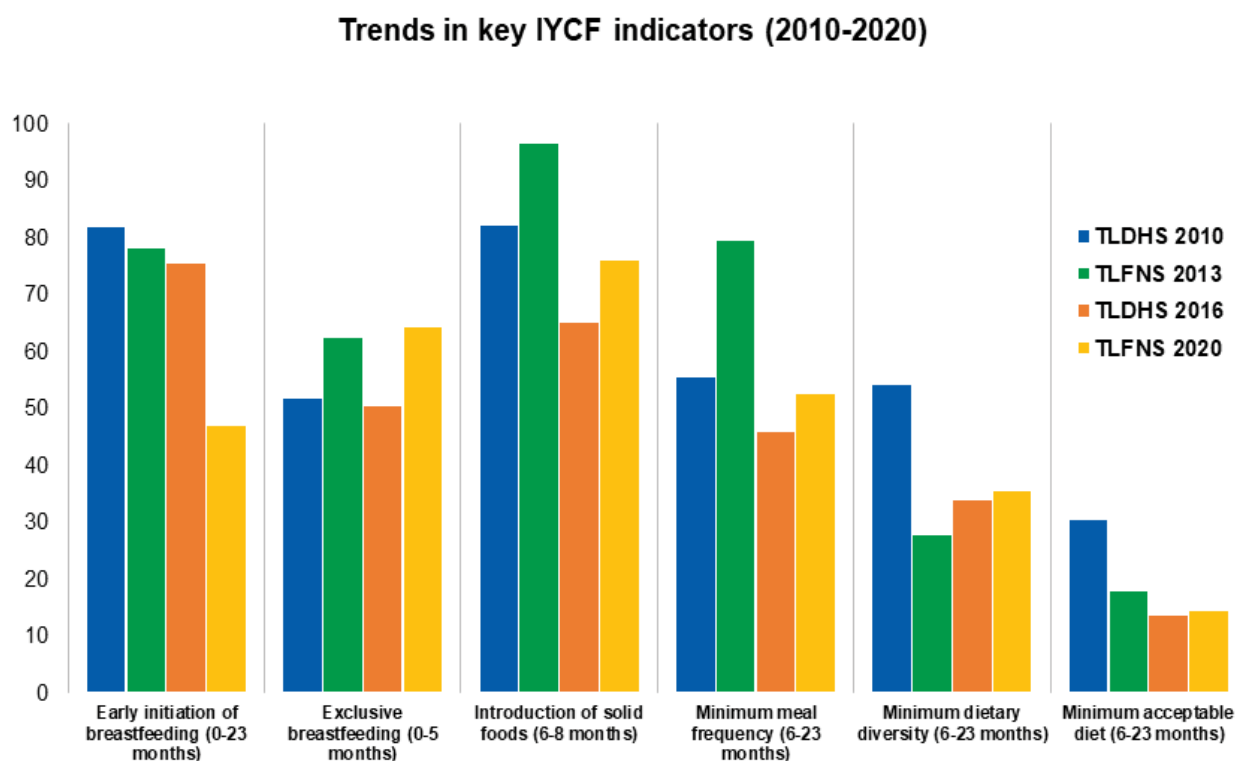

Wealth quintile

The proportion of children 6-8 months who had been introduced to solid foods was 75.8% (72.5-79.0, 95% C.I). Slightly over half of children 6-23 months achieved the minimum meal frequency (52.3%, 50.7-53.9, 95% C.I) and minimum dietary diversity (35.3%, 33.8-36.8, 95% C.I), and only 14.3% (13.2-15.4, 95% C.I) met the minimum acceptable diet. Milk feeding frequency for non-breastfed children 6-23 months was met by 29.3% (24.2-34.5, 95% C.I) while the coverage of age-appropriate breastfeeding was 39.3% (37.9-40.7, 95% C.I) for children 0-23 months (Table 28.).

Figure 8. Trends in key IYCF indicators (2010-2020)

The analysis of trends in key IYCF indicators reveals that early initiation of breastfeeding has been on a decreasing trend, while exclusive breastfeeding and introduction to solid foods at 6 months increased in 2020 compared to 2016. The results for minimum meal frequency, minimum dietary diversity and minimum acceptable diet were similar to what was observed in 2016 (Figure 8).

Figure 9 below shows the proportion of children who consumed different food groups. A very high proportion had consumed grains, roots and tubers (97.5%) and breast milk (90.6%), as well as Vitamin A-rich fruits and vegetables (71.5%). Consumption of dairy products (0.8%) was very low, while consumption of flesh foods (23.1%) and legumes or nuts (31.0%) was also quite low.

Figure 9. Proportion of children 6-23 months consuming different food groups

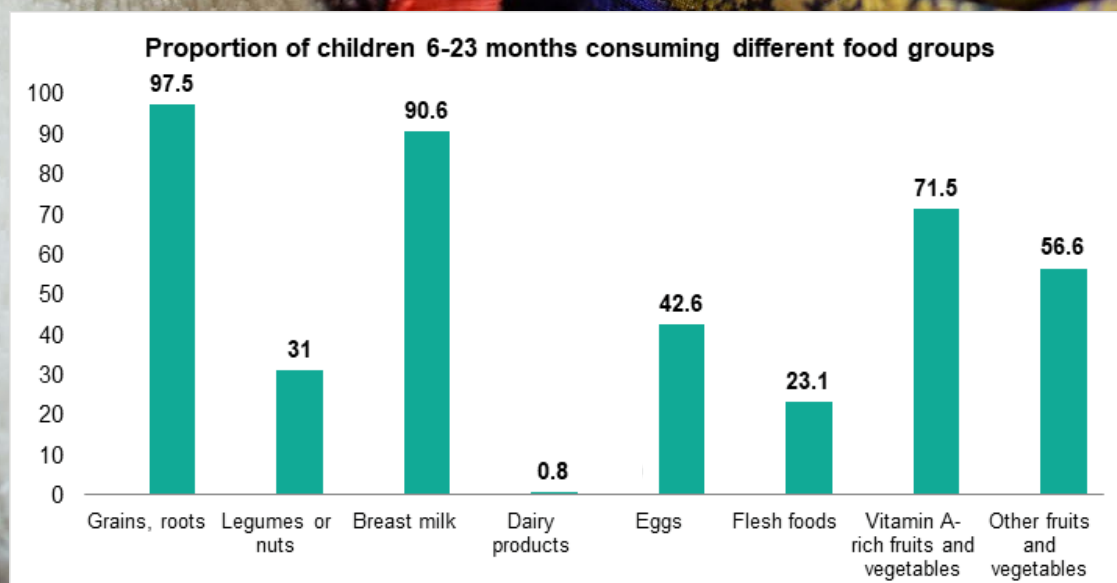

Table 29. Consumption of different food groups (6-23 months) by municipality, TLFNS 2020

3.3 Women of reproductive age (15-49 years)

3.3.1 Characteristics of sample

A total of 13,370 women of reproductive age were interviewed. Of these, 6.5% were pregnant, 27.4% were lactating, and 0.5% were both pregnant and lactating (Table 31). The proportion of pregnant women was highest in the 20-29 age group, and higher in rural areas (7.0%) than urban areas (5.5%).

3.3.2 Body mass index (BMI)

Of the non-pregnant women in the sample, 18.8% (18.1-19.5, 95% C.I) were thin (BMI<18.5), while 19.3% (18.6-20.0, 95% C.I) were overweight/obese (BMI>=25). The proportion of women classified as thin was highest in the 15-19 age group, and generally decreased with age, while the reverse was true for overweight/obesity (Table 32). The highest proportion of thin women was found in Oe-cusse (26.0%) and Bobonaro (23.9%) and was higher in rural areas (18.9%) than urban areas (17.3%).

3.3.3 Mid-upper arm circumference (MUAC) and short stature

Malnutrition was also assessed using height and MUAC for all women of reproductive age. Of those who were sampled, 12.6% (12.1-13.2, 95% C.I) were of short stature (<145cm). The proportion increased with age from 10.6% in the 15-19 age group to 17.2% in the 40-49 age group. Just as with stunting among children, Ermera (19.2%) had the highest proportion of women of short stature, followed by Aileu (15.5%) and Ainaro (14.8%). Rural women (14.0%) had a higher prevalence of short stature than urban women (9.9%). The proportion of women of low stature increased as wealth quintile decreased (Table 33). 9.4% (8.9-9.9, 95% C.I) of women had a MUAC below 21cm, with 21.9% (21.2-22.6, 95% C.I) having a MUAC between 21 and 22.9cm. For pregnant and lactating women, the proportions were similar (8.9%, 8.2-9.8, 95% C.I and 23.2%, 22.0-24.4, 95% C.I respectively), and were much higher among rural women than urban women and were also lowest in the highest wealth quintile.

Table 33. Short stature and acute malnutrition among women (15-49 years) based on Mid Upper Arm Circumference (MUAC) by age group, municipality, residence and wealth quintile, TLFNS 2020

Figure 10. Trends in prevalence of malnutrition in women of reproductive age (2010-2020)

As presented in Figure 10, the prevalence of short stature increased in 2020 compared to 2016, having decreased from 2010 to 2016. The proportion of women who were underweight decreased (26.6% in 2016 to 18.8% in 2020) while the proportion who were overweight/obese also increased (9.8% in 2016 to 19.3% in 2020). The differences between 2016 and 2020 were all statistically significant ($p < 0.05$).

3.3.4 Antenatal care and supplementation

6661/6806 (97.9%) of the sampled women reported having accessed antenatal care during the last pregnancy. For the vast majority, the provider of antenatal care were midwives (72.0%, 70.9-73.2, 95% C.I.), followed by medical doctors (21.6%, 20.6-22.7, 95% C.I.). A very small proportion reported having accessed antenatal care from nurses, nurse assistants, and traditional birth attendants (Table 34).

3.3.5 Minimum dietary diversity for women (MDD-W)

The proportion of women who met the minimum dietary diversity was 65.4% (64.6-66.2, 95% C.I). The proportion did not differ significantly between age groups. The municipality with the lowest MDD-W was Manatuto, with 45.4% (38.1-52.8, 95% C.I), followed by Baucau, with 50.1% (42.7-57.4, 95% C.I). MDD-W was higher among urban women (65.3%) than rural women (57.7%) and was lowest in the lowest wealth quintile (50.1%), increasing to 78.3% in the highest wealth quintile (Table 37).

Table 37. Dietary diversity for women by age group, municipality, residence and wealth quintile, TLFNS 2020

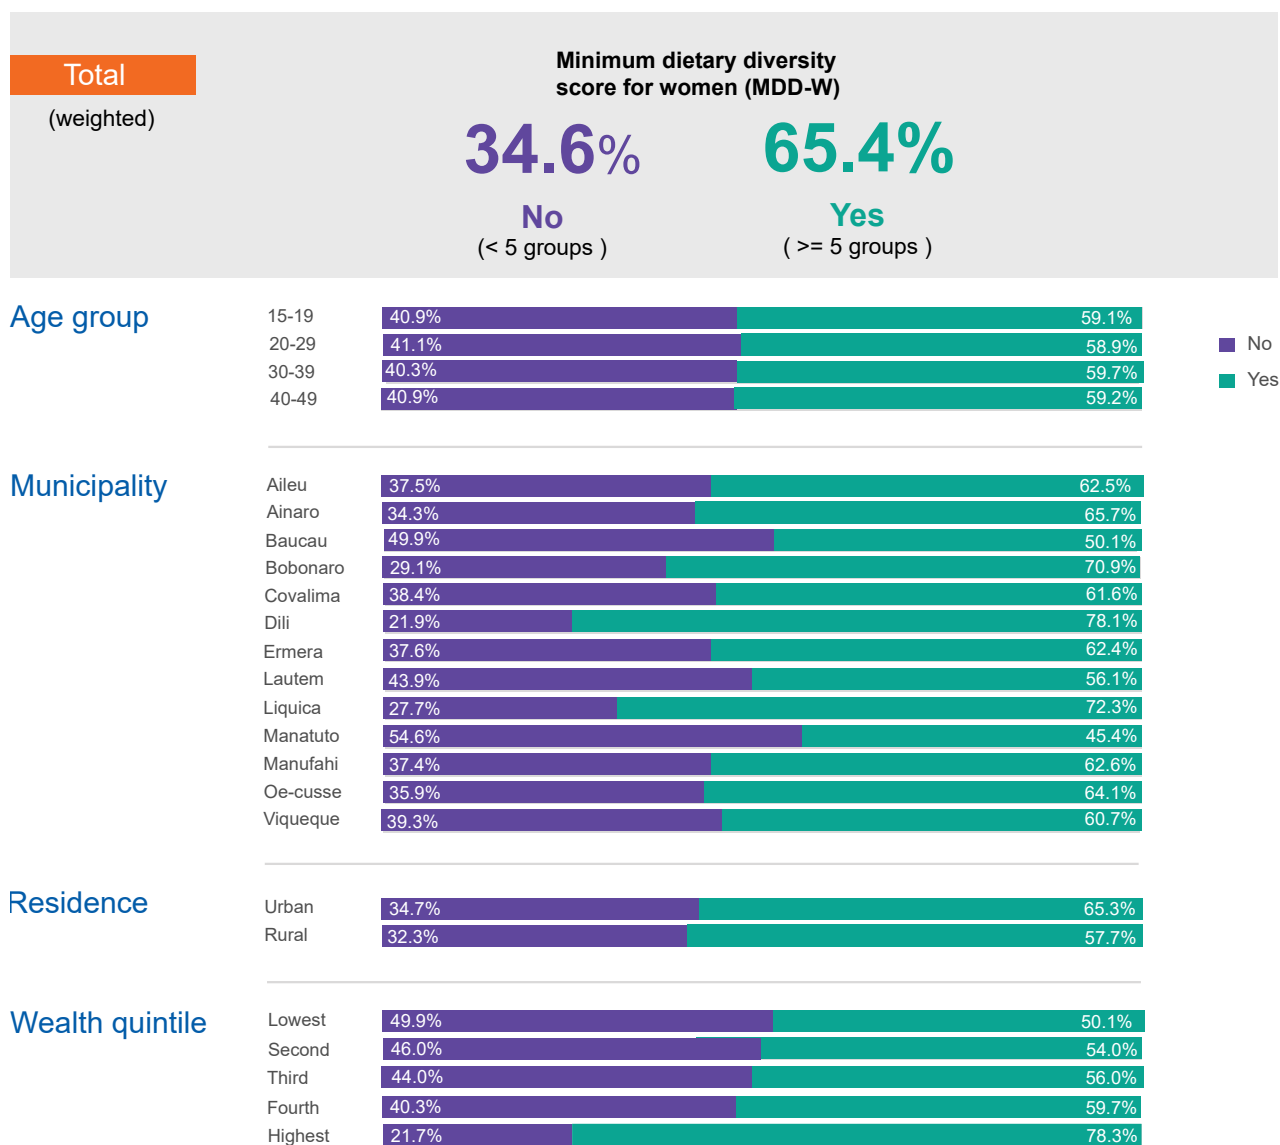

Table 38 shows the proportion of different food groups consumed by municipality. Generally, consumption of grains/roots/tubers, dark green leafy vegetables and other vegetables was high, while consumption of dairy products, flesh foods, nuts/seeds and other fruits was quite low.

Table 38. Women's consumption of different food groups by municipality, TLFNS 2020

Nearly 9 in 10 women reported consumption of sugar sweetened beverages (86.3%, 85.8-86.9, 95% C.I.), with more than 7 in 10 (71.4, 70.6-72.2, 95% C.I.) reporting consumption of sweet or savoury junk foods. Only 2.7% (2.5-3.0, 95% C.I.) consumed no fruits or vegetables, and over 1 in 3 (36.2%, 35.4-37.0, 95% C.I.) consumed no eggs and/or flesh foods (Table 39). The proportion of women who consumed sugar sweetened beverages was higher in rural women (87.8%) than urban women (83.5%), and highest in the lowest quintile, and lowest in the highest wealth quintile. The consumption of sweet or savoury junk foods was higher in urban women (75.7%) than rural women (66.8%) and was highest in the highest wealth quintile (77.2%) and lowest in the lowest wealth quintile (64.7%). The proportion who consumed no eggs and/or flesh foods was much higher in rural women (42.5%) than urban women (27.0%) and increased with decreasing wealth quintile from only 16.1% in the highest wealth quintile to 52.4% in the lowest wealth quintile.

3.4 Wealth index

An asset-based wealth index was constructed. Households were ranked by asset ownership. Assets included consumer durables (such as television, fridge, and computer), housing characteristics (type of building material-wall, floor and roof) and access to basic services (water, toilets and electricity). The assets were entered into a Principal Component Analysis and first factor chosen as wealth index. The rural population had only 11.6% in the highest quintile compared to 44.7% for the urban population. Ermera had the lowest population in the highest quintile (5.9%), followed by Ainaro (6.5%). These were also the municipalities with the highest prevalence of stunting among children (Table 40).

Table 40. Wealth quintiles by municipality and residence, TLFNS 2020

3.5 Household Food Security

3.5.1 Food consumption score (FCS)

The Food Consumption Score (FCS) is the most commonly used food security indicator. It represents households' dietary diversity and nutrient intake. The FCS is calculated by inspecting how often households consume food items from the different food groups during a 7-day reference period, which are then weighted according to the relative nutritional value of the consumed food groups. Of the surveyed households, 35.1% (34.2-35.9, 95% C.I.) had poor food consumption, while 29.9% (29.2-30.7, 95% C.I.) had borderline food consumption and 34.8% (34.0-35.6, 95% C.I.) had acceptable food consumption (Table 41). Covalima had the highest percentage of households with poor food consumption, at 45.5% (38.7-52.2, 95% C.I.), and this was followed by Ermera, with 42.4% (34.9-49.8, 95% C.I.). The percentage with poor food consumption was higher in rural households (39.2%) than urban households (30.4%) and increased from 19.9% in the lowest wealth quintile to 44.9% in the highest wealth quintile.

Table 41. Food consumption score (FCS) by municipality, residence and wealth quintile, TLFNS 2020

Table 42 presents the frequency of consumption of different food groups. The results indicate that the diet consumed by most households on a daily basis was low in terms of consumption of fruits, dairy products, legumes/nuts/seeds, as well as meat/fish.

3.5.2 Iodised salt use

The percentage of households who consumed iodized salt was very high at 84.8% (84.2-85.4, 95% C.I.). The percentage was similar in urban and rural households, as well as wealth quintiles, as expected, was highest in Dili (Table 43).

3.5.3 Food Insecurity Experience Scale (FIES)

The Food Insecurity Experience Scale (FIES) is a measure of access to food at the level of individuals or households. It measures severity of food insecurity based on people's responses to questions about constraints on their ability to obtain adequate food. Eight questions form a quantitative tool to measure the prevalence of food insecurity. The proportion of households classified as food secure/mild food insecure was 49.6% (48.7-50.5, 95% C.I), with 34.8% (33.9-35.6, 95% C.I) classified as moderate food insecure and 15.6% (15.0-16.2, 95% C.I) classified as severe food insecure (Table 44). Covalima (21.1%), Oecusse (20.4%) and Bobonaro (19.4%) had the highest percentage classified as severe food insecure, and the proportion was slightly higher among rural households (17.3%) than urban households (15.6%). The lowest wealth quintile had the lowest percentage classified as severe food insecure.

Table 44. Food Insecurity Experience Scale (FIES) by municipality, residence and wealth quintile, TLFNS 2020

3.6 Water, sanitation and hygiene

3.6.1 Access to drinking water

The type of drinking water sources are presented in Table 45. The main source for most households was the public tap/standpipe, with 87.8% (87.2-88.3, 95% C.I) having access to an improved drinking water source. Urban households (89.3%) had more access to an improved drinking water source than rural households (83.5%). In terms of wealth quintiles, the proportion did not vary much between lowest to the fourth quintiles, but highest in the highest quintile (88.1%).

3.6.2 Access to sanitation facilities

The types of toilet facilities are shown in Table 46. The most frequently used type of facility was a flush latrine with septic tank (38.0%, 37.2-38.8, 95% C.I), followed by a pit latrine with a slab (31.1%, 30.3-31.9, 95% C.I), with a lower proportion using pit latrine without slab (9.9%, 9.3-10.4, 95% C.I), flush latrine without septic tank (9.4%, 8.9-9.9, 95% C.I) and 11.6% (11.1-12.2, 95% C.I) without a toilet facility (Table 46).

The proportion of households with access to an improved sanitation facility at national level was 68.2% (67.4-69.0, 95% C.I), with 52.2% (51.4-53.1, 95% C.I) having access to an improved excreta disposal facility (Table 47). The percentage with access to an improved sanitation facility ranged from 39.6% in Baucau to 90.5% in Dili and was much higher in urban households (78.7%) than rural households (60.3%). The highest wealth quintile had a much higher percentage with access to an improved sanitation facility than the lower quintiles.

3.6.3 Handwashing

The hand washing method for nearly all households was soap and water (87.1%, 86.5-87.7, 95% C.I), and a high proportion of households reported washing their hands before eating (80.0%, 79.3-80.7, 95% C.I), although a lower proportion reported washing their hands before cooking food (45.1%, 44.3-46.0, 95% C.I), after defecation (28.5%, 27.8-29.3, 95% C.I), and a much lower proportion after disposing child's faeces (6.1%, 5.6-6.5, 95% C.I) and before breastfeeding/feeding children (6.2%, 5.8-6.6, 95% C.I) as shown in Table 48.

3.7 Determinants of stunting and wasting among children (0-59 months)

Determinants of stunting are analysed in Table 50 and 51 using regression analysis. Stunting was highly associated with diarrhoea ($p < 0.001$) and fever ($p < 0.001$) in terms of morbidity. Stunting also showed strong association with education status of mother/caregiver ($p < 0.001$), wealth quintile ($p < 0.001$) and lack of access to improved sanitation ($p < 0.001$).

Discussion

Discussion

4.1 Nutritional status among children 0-59 months based on WHO 2006 standards

Anthropometry for children was assessed using WHO 2006 standards. A total of 11,246 children 0-59 months were measured in the 2020 TLFNS, which was considerably higher than the overall target of 9,048. This was due to two factors:

- i. the initial target number of households for each municipality were rounded up from 980 to 992
- ii. there were more children below 5 years than anticipated based on the actual population structure.

The plausibility report generated from ENA-for-SMART revealed that the quality of anthropometric data met the required threshold in terms of the important parameters which are required for acceptability of data. Only 1.3% of the values were flagged as being out of range for the weight-for-height indicator. Digit preference for weight and height were excellent, while that of MUAC was good. The standard deviation of WHZ, a key indicator, was excellent, as was skewness, kurtosis and passion distribution.

The prevalence of stunting was 47.1% (46.2-48.0, 95% C.I), with a moderate and severe stunting prevalence of 30.2% (29.4-31.1, 95% C.I) and 16.9% (16.2-17.6, 95% C.I). The stunting prevalence was well above the WHO “very high” threshold of $\geq 30\%$. Stunting was higher for boys (52.0%) than girls (46.6%), and much higher in rural areas (52.5%) than urban areas (39.8%). As observed in previous surveys, stunting was highest in Ermera (63.4%), Ainaro (60.3%) and Oe-cusse (57.1%). Children with mothers/caregivers with lower education status had a higher prevalence of stunting. The prevalence of underweight was 32.4% (31.5-33.2, 95% C.I), with a moderate and severe underweight prevalence of 24.8% (24.0-25.5, 95% C.I) and 7.6% (7.1-8.1, 95% C.I), respectively. The prevalence of global acute malnutrition (GAM) was 8.6% (8.1-9.1, 95% C.I). The moderate acute malnutrition (MAM) was 7.1% (6.7-7.6, 95% C.I) and the prevalence of severe acute malnutrition (SAM) was 1.5% (1.2-1.7, 95% C.I). The prevalence of wasting was in the “medium” category of WHO classification. The GAM prevalence was higher in males (8.9%) than females (6.3%). GAM was highest in Oe-cusse (13.0%), Bobonaro (11.8%), and Dili (10.1%) and was higher in urban (8.9%) than rural areas (7.3%).

In general, there is an improvement in the nutrition situation, as stunting decreased to 47.1% compared to 50.2% in 2013 and 58.1% in 2010. Underweight decreased to 32.4% from 37.7% in 2016 and 44.7% in 2010. Wasting decreased to 8.6% compared to 11.0% in 2016 and 18.6% in 2010. The prevalence of acute malnutrition was much higher based on WHZ (8.6%) than MUAC (4.7%). The prevalence of malnutrition increased with decreasing wealth quintile for stunting and underweight, but the reverse was true for wasting. The prevalence of acute malnutrition was highest in the 12-23 months age group. Stunting increased with age and peaked at the 24-35 months age group then began to decrease. Underweight peaked at the 24-35 months age group then was almost unchanged up to the 48-59 months age group. Malnutrition decreased as maternal education status increased. Stunting and underweight were higher in rural children than urban children, while the reverse was true for wasting.

4.2 Morbidity, vaccination and supplementation for children 0-59 months

In terms of morbidity, 15.2% (14.5-15.8, 95% C.I) reported having experienced diarrhoea in the past 14 days, with 9.9% (9.3-10.4, 95% C.I) for acute respiratory infection, and 23.5% (22.8-24.3, 95% C.I) for fever (without cough). The coverage of measles vaccination was 86.3% (83.5-89.2, 95% C.I), with 60.3% (59.2-61.4, 95% C.I) confirmed by the card. 77.8% (76.9-78.5, 95% C.I) of eligible children had received Vitamin A supplementation in the last 6 months, while the coverage of deworming was 71.4% (70.5-72.4, 95% C.I). The proportion of children who received micronutrient powder was 18.1% (16.9-19.3, 95% C.I).

4.3 Infant and young child feeding for children 0-23 months

The proportion of children 0-23 months who were introduced to breast milk within the first hour after birth was only 46.8% (45.2-48.4, 95% C.I). The prevalence of exclusive breastfeeding was 64.2% (61.4-67.0, 95% C.I). The prevalence of bottle feeding was 32.1% (30.7-33.4, 95% C.I). Exclusive breastfeeding was higher among females (70.7%) than males (66.5%), and in urban areas (70.8%) than rural areas (60.8%) and was also lowest in the highest wealth quintile. Continued breastfeeding at 1 year (12-15 months) was 68.4% (64.9-72.0, 95% C.I), and only 29.2% (24.9-33.6, 95% C.I) at 2 years (20-23 months). 75.8% (72.5-79.0, 95% C.I) of children aged 6-8 months had been introduced to solid foods at 6 months (6-8 months). The proportion of children 6-23 months who achieved a minimum meal frequency (MMF) was 52.3% (50.7-53.9, 95% C.I), and 35.3% (33.8-36.8, 95% C.I) met the minimum dietary diversity (MDD). Only 14.3% (13.2-15.4, 95% C.I) in the same age group met the minimum acceptable diet (MAD). In comparison with previous years, early initiation of breastfeeding continued to decrease, while exclusive breastfeeding improved. There was also an improvement in timely introduction of solid foods. Minimum dietary diversity remained unchanged, while minimum meals frequency and minimum acceptable diet decreased.

4.4 Health and nutrition status of women of reproductive age (15-49 years)

In terms of Body Mass Index (BMI), 18.8% (18.1-19.5, 95% C.I) of non-pregnant women in the sample were thin (BMI<18.5), while 19.3% (18.6-20.0, 95% C.I) were overweight/obese (BMI>=25). The proportion of women classified as thin was highest in the 15-19 age group, and generally decreased with age, while the reverse was true for overweight/obesity. The highest proportion of thin women was found in Oe-cusse (26.0%) and Bobonaro (23.9%), and was higher in rural areas (18.9%) than urban areas (17.3%). The prevalence of thinness decreased from 26.6% in 2016 to 18.8% in 2020, while the prevalence of overweight/obesity nearly doubled from 9.8% in 2016 to 19.3% in 2020. 12.6% (12.1-13.2, 95% C.I) women were of short stature (<145cm). The proportion increased with age from 10.6% in the 15-19 age group to 17.2% in the 40-49 age group. Just as with stunting among children, Ermera (19.2%) had the highest proportion of women of short stature, followed by Aileu (15.5%) and Ainaro (14.8%). Rural women (14.0%) had a higher prevalence of short stature than urban women (9.9%). The proportion of women of low stature increased as wealth quintile decreased. Based on MUAC for pregnant and lactating women, 8.9% (8.2-9.8, 95% C.I) had a low MUAC (below 21cm), with 23.2% (22.0-24.4, 95% C.I) at risk (21-22.9cm). Among pregnant and lactating women, 8.9% (8.2-9.8, 95% C.I) were b and 23.2%, 22.0-24.4, 95% C.I respectively), and were much higher among rural women than urban women and were also lowest in the highest wealth quintile. The main provider of antenatal care were midwives (72.0%, 70.9-73.2, 95% C.I), followed by medical doctors (21.6%, 20.6-22.7, 95% C.I). Most women (64.1%, 62.9-65.4, 95% C.I) had 4-7 visits in their last pregnancy, while 19.0% (18.0-20.0, 95% C.I) having 8 or more visits. The minimum dietary diversity for women (MDD-W) was met by 65.4% (64.6-66.2, 95% C.I) of sampled women, with 65.3% for urban women and 57.7% for rural women, and the proportion increased as wealth quintile increased. There was generally a high consumption of sweet and savoury junk foods as well as sugar sweetened beverages.

4.5 Wealth index

Based on principal component analysis (PCA) of the wealth index which was based on assets, there were 11.6% of rural households in the highest quintile compared to 44.7% of urban households. Ermera and Ainaro were the municipalities with the lowest socio-economic status. These were the same households with the highest prevalence of stunting.

4.6 Food security

In terms of Food Consumption Score (FCS), 35.1% (34.2-35.9, 95% C.I) of households had poor food consumption, while 29.9% (29.2-30.7, 95% C.I) had borderline food consumption and 34.8% (34.0-35.6, 95% C.I) had acceptable food consumption. The highest percentage of households with poor food consumption were found in Covalima (45.5%) and Ermera (42.4%). There were more rural households (39.2%) than urban households (30.4%) with poor food consumption. FCS increased with wealth quintile. The Food Insecurity Experience Scale (FIES) classified 49.6% (48.7-50.5, 95% C.I) of households as food secure/mild food insecure, 34.8% (33.9-35.6, 95% C.I) as moderate food insecure and 15.6% (15.0-16.2, 95% C.I) as severe food insecure. The highest proportion of severely food insecure households were found in Covalima (21.1%), Oe-cusse (20.4%) and Bobonaro (19.4%), and there was a marginally higher proportion in rural households (17.3%) than urban households (15.6%). The proportion of severely food insecure households increased as wealth quintile decreased.

4.7 Water, sanitation and hygiene

At national level, 87.8% (87.2-88.3, 95% C.I) of households had access to an improved drinking water source, with a higher percentage among urban households (89.3%) than rural households (83.5%). In terms of wealth quintiles, the proportion did not vary much between lowest to the fourth quintiles but was highest in the highest quintile. Overall, 68.2% (67.4-69.0, 95% C.I) had access to an improved sanitation facility, and 52.2% (51.4-53.1, 95% C.I) had access to an improved excreta disposal facility. The percentage with access to an improved sanitation facility ranged from 39.6% in Baucau to 90.5% in Dili and was much higher in urban households (78.7%) than rural households (60.3%). The highest wealth quintile had a much higher percentage with access to an improved sanitation facility than the lower quintiles. For almost all households (87.1%, 86.5-87.7, 95% C.I), the main hand washing method was soap and water and a high proportion of households reported washing their hands before eating was 80.0% (79.3-80.7, 95% C.I), although a lower proportion reported washing their hands before cooking food (45.1%, 44.3-46.0, 95% C.I), after defecation (28.5%, 27.8-29.3, 95% C.I), and a much lower proportion after disposing child's faeces (6.1%, 5.6-6.5, 95% C.I) and before breastfeeding/feeding children (6.2%, 5.8-6.6, 95% C.I).

4.8 Determinants of stunting and wasting

According to the conceptual framework of malnutrition, nutritional status is determined by immediate, underlying and basic causes. The association between stunting and related factors was analysed using logistic regression analysis. The results revealed that stunting was strongly associated with diarrhoea ($p < 0.001$) and fever ($p < 0.001$) in terms of morbidity. Stunting also showed strong association with education status of mother/caregiver ($p < 0.001$), wealth quintile ($p < 0.001$) and lack of access to improved sanitation ($p < 0.001$). Wasting was associated with diarrhoea ($p = 0.001$), fever ($p < 0.001$) and wealth quintile ($p < 0.05$).

05

Conclusion and recommendations

Conclusion and recommendations

The nutrition situation in Timor-Leste showed an improvement compared to the previous national survey conducted in 2013, with a decrease in stunting from 50.2% to 47.1% and a decrease in wasting from 11.0% to 8.6%, as well as a decrease in underweight from 37.3% to 32.4%. However, malnutrition remains a major public health challenge, especially given that the prevalence of stunting remains one of the highest in the world. Stunting was well above the “very high” threshold set by WHO. Stunting showed strong association with residence, with rural children more likely to be stunted, and with maternal education status. There was also a strong association with wealth quintile. Infant and young child feeding indicators were also unsatisfactory with little improvement from previous surveys, which is an area of concern. Maternal nutritional status results indicated that, although there has been an improvement in undernutrition, there has been a huge increase in the proportion of women who were overweight/obese. Household access to safe drinking water was generally very high, with some improvements required in terms of sanitation, which was also associated with stunting.

Recommendations

01

Improving the Nutritional status among children 0-59 months

Increase the coverage of high-impact intervention to address the immediate and underlying causes of malnutrition, focusing on pre-pregnancy and the first 1,000 days to reduce all forms of malnutrition. Prevent and control wasting in children aged 0-59 months by providing community- and inpatient-based treatment and providing food supplements in food insecure areas. Implement a robust social behavior change communication for collective action, community ownership with integrated interpersonal communication (one-on-one counselling), education, and national scale media and community mobilization. Strengthen the capacity of health care providers to deliver quality maternal, infant, young children, and adolescent health and nutrition services at health facility and community levels. Revitalize growth monitoring, promotion and education, including routine screening, early case detection, referral, treatment, and follow-up of cases at all levels. Increase coverage of management of acute malnutrition by establishing a MUAC cut-off point which includes most of the wasted children and early detection of malnourished children. Strengthen the capacity of the health workforce and community volunteers for effective programming and delivery of quality services to prevent and treat all forms of malnutrition. Enforce legal mechanisms to guide the delivery of nutrition services and support improvement in nutrition status.

02

Morbidity, Vaccination, and supplementation for children 0-59 months

Address the causes of diarrhoea and acute respiratory infections among children through robust education to families to inform of the importance of health-seeking immediately when the children get sick as well as promote access to maternal, newborn and child health services. Maintain immunization coverage to protect children from vaccine preventable diseases and invest more efforts to reach the unreached population. Intensify prevention and control of micronutrient deficiencies by strengthening and promoting access to quality services for micronutrient supplementation for children under five, especially the multiple micronutrient powders (MNP) for children 6-23 months.

03

Infant and young child feeding for children 0-23 months

Invest in support for early breastfeeding initiation (within 1 hour after delivery) by increasing health workers' capacity to provide quality services, including counselling during antenatal care (ANC). Continue to promote exclusive breastfeeding for infants 0-6 months at facility, community and household levels with continued breastfeeding and appropriate complementary feeding of children aged 6 to 23 months and beyond, and optimal feeding during illness while focusing on improving dietary diversity, improving coverage of micronutrient supplementation and food fortification programs. Expand counselling and education for a healthy diet at antenatal care (ANC), postnatal, growth monitoring visits, and other outreach services by integrating SBCC as an essential component to support families to improve household food consumption and quality of child diet. The critical messages for caretakers of children should include the importance of a healthy diet and physical activity promotion in national nutrition strategy to tackle the emerging overweight and obesity. In addition, incorporate obesity prevention in the school nutrition program.

04

Health and nutrition status of women of reproductive age (15-49 years)

Promote women's nutrition before, during, and after pregnancy. Address malnutrition in women before they become pregnant by implementing universal micronutrient supplementation for all pregnant women and adolescent girls through schools and community platforms for out-of-school adolescents. Strengthen school nutrition to ensure that the school is a healthy environment free from advertisements and access to unhealthy foods while guaranteeing access to nutritious foods and clean water. Set up a targeted supplementary feeding program for pregnant and lactating women of reproductive age based on MUAC criteria.

05

Wealth index

Continue advocacy on intensifying the implementation of poverty reduction strategies to address the disparities and malnutrition—advocate for scaleup of cash-based transfer linking it to nutrition outcomes. Focus on poor wealth quintiles and poor households on nutrition education because children in those households are at higher risk of malnutrition.

06

Food Security

Promote and support domestic household food production to improve food availability. Advocate for expansion of nutrition sensitive interventions such as cash transfers for poor households with pregnant and lactating women and children under 2 years of age to increase household purchasing power and hence access to nutritious foods. Ensure the access to food is complemented with the right knowledge of caretakers on dietary diversity and appropriate feeding practices.

07

Water sanitation and hygiene

Continue to implement the flagship intervention of community-led total sanitation (CLTS) and support the communities to adopt “the open defecation free” (ODF) status. Scale up the promotion of hygiene and sanitation practices at the health facilities, schools, community and household levels including communication with integrated messages on handwashing with soap and water at critical times, keeping a clean environment for handling food, use safe water, promote a hygienic toilet, safely remove and treat fecal waste, stop open defecation, and access to sanitation.

08

Address the determinant of stunting

First, invest in understanding the drivers of poor nutrition in children and women and tailor a response that significantly reduces child stunting. Second, strengthen the inter-ministerial/ inter-sectoral collaboration and coordination to implement critical nutrition-sensitive activities in preventing stunting effectively. Third, define the roles and responsibilities of each sector in reducing child stunting and, importantly, co-locate the interventions of all sectors. In all instances, national strategies must prioritize the most vulnerable children: the youngest, the poorest, and the socially excluded. Finally, measure the performance of national systems in delivering essential interventions to prevent stunting and tracking investments and expenditures against costed plans to ensure public accountability and indicate good governance.

Annex 3. Training agenda

Day 1		
Topics	Comments/Questions to be answered	
0800-0830	Introduction of participants and facilitator (s)	<ul style="list-style-type: none"> Participants introduce themselves and outline expectations and ground rules
0830-0900	Pre-test	<ul style="list-style-type: none"> Participants take pre-test to test knowledge before training
0900-1000	Introduction to surveys	<ul style="list-style-type: none"> Why do we conduct surveys? What are the characteristics of a good survey?
1030-1115	Introduction to Timor-Leste Food and Nutrition Survey rationale and objectives	<ul style="list-style-type: none"> What are the specific objectives for TLFNS 2019?
1115-1200	Survey team composition, roles and responsibilities	<ul style="list-style-type: none"> What are the responsibilities of each team member?
1200-1245	Introduction to sampling	<ul style="list-style-type: none"> What is sampling? Which sampling methods are commonly used in nutrition surveys?
1400-1500	Sampling in TLFNS 2019	<ul style="list-style-type: none"> Which sampling method will be used in TLFNS 2019 and how will it be applied?
1500-1530	Introduction to anthropometry	<ul style="list-style-type: none"> What is anthropometry? What are the building blocks?
1530-1600	SMART anthropometry video and discussion	<ul style="list-style-type: none"> View an instructional video on SMART and ask questions
1600-1630	Mini-practical for anthropometric measurements?	<ul style="list-style-type: none"> Practice session to familiarize with the use of anthropometric equipment
Day 2		
Topics	Comments/Questions to be answered	
0800-0830	Recap of day 1	<ul style="list-style-type: none"> A short quiz to remind participants of day 1 key learning points
0830-1000	Anthropometry practice Age estimation-Local calendar	<ul style="list-style-type: none"> A short exercise with anthropometric measurements with a few children. How is age recorded when there is no official age document? How is the local calendar of events used? Update TLFNS 2020
1030-1115	Interviewing techniques	<ul style="list-style-type: none"> What are the things to watch out for when conducting interviews? What makes a good or bad interview?
1115-1245	Questionnaire familiarization-session	<ul style="list-style-type: none"> Familiarization with questionnaire modules (paper format), to ensure that participants understand how questions should be asked
1400-1430	Questionnaire familiarization-session 2	<ul style="list-style-type: none"> Familiarization with questionnaire modules (paper format), to ensure that participants understand how questions should be asked
1430-1600	Questionnaire familiarization-session 3	
1600-1630	Questionnaire familiarization-wrap up	
Day 3		
Topics	Comments/Questions to be answered	
0800-0830	Post-test	<ul style="list-style-type: none"> Post-test to be compared with pre-test
0830-0900	Data collection using android tablet-introduction	<ul style="list-style-type: none"> Safe-keeping and appropriate use; Maintaining battery power, charging;
0900-1000	Data entry-Child module	<ul style="list-style-type: none"> Step-by-step data entry practice

Day 3		
Topics	Comments/Questions to be answered	
1030-1115 1115-1230	Data entry-Women module Data entry-household module	<ul style="list-style-type: none"> • Step-by-step data entry practice • Step-by-step data entry practice
1500-1600 1600-1630	Special cases in the field Introduction to standardization test	<ul style="list-style-type: none"> • How will households be defined? How will compounds be defined? How will absent or empty households/children be handled? What happens when there are no children in the household? What happens if the household refuses to be interviewed? How do we deal with children in health centres? How will the standardization test be conducted? What is its purpose and importance?
Day 4		
Topics	Comments/Questions to be answered	
0800-0830 0830-0930 0930-1230 1400-1600	Recap of day 4 Preparation for standardization test Standardisation test round 1 Standardisation test round 1	<ul style="list-style-type: none"> • A short quiz to remind participants of day 4 key learning points • Preparation of mother-to-child pairs and stations • First round of measurements • Second round of measurements
Day 5		
Topics	Comments/Questions to be answered	
0830-0900 0900-1630	Standardisation test feedback Pilot test in the field including final debriefing session	<ul style="list-style-type: none"> • Feedback on team performance • Pilot test in the field followed by final debriefing before teams are deployed to the field

Annex 5. Survey questionnaire

MUNICIPALITY _____ SUCO _____ ALDEIA _____
 RURAL/URBAN _____ SURVEY DATE _____ CLUSTER _____
 TEAM _____ HOUSEHOLD _____

INTRODUCTION AND CONSENT

Hello, My name is _____ and my colleagues' are _____. We are working for the Ministry of Health. We are here to conduct the Timor-Leste National Food and Nutrition Survey to gather information related to demography, nutrition, health, food security and water, sanitation & hygiene of people living in Timor-Leste. If there are any women (aged 15-49 years) or children under five years old in the household we would like to take some measurements to assess their nutritional status. All personal information will be kept confidential. Please note that it is not currently known what actions if any will be taken after the results of the survey are finalized. This survey will provide important information to guide programmes which seek to improve the general living conditions of people in Timor-Leste. The questions will take about 30 minutes. Do you have any questions? May I begin?

Yes=1; No=2; Absent=3

1. HOUSEHOLD MODULE

1a. HOUSEHOLD CHARACTERISTICS, FOOD SECURITY AND COPING MECHANISMS

Socio-economic status

Did the household give its consent to be interviewed?	1=Yes 2=No 3=Absent
How many people live in this household?	<input type="text"/>
What is the sex of the household head?	1=Male; 2=Female
What is the age of the household head?	<input type="text"/>
What is the type of cooking fuel used by this household?	1=Electricity 2=LPG 3=Natural gas 4=Biogas 5=Kerosene 6=Charcoal 7=Wood 8=Straw/Shrubs/Grass 9=Agricultural crop 10=Animal dung 99=Other
What is the type of floor in this household? (OBSERVE)	1=Dirt/earth 2=Brick/ceramic/tile 3=Bamboo/wood 99=Other
What is the type of wall in this household? (OBSERVE)	1=Wood/bamboo/petiole of palm tree/galvanized steel 2=Brick 3=Brick and wood/bamboo 4=Mud 99=Other

Ducks
Do you own this house?	1=Yes, 0=No
Do you own land?	1=Yes, 0=No

Food Insecurity Experience Scale (FIES)

During the last 12 MONTHS, was there a time when you or others in your household:		
1	Were worried you would run out of food because of a lack of money or other resources? (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	
2	Were unable to eat healthy and nutritious food because of a lack of money or other resources? 3 (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	
3	Ate only a few kinds of foods because of a lack of money or other resources? (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	
4	Had to skip a meal because there was not enough money or other resources to get food? (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	
5	Ate less than you thought you should because of a lack of money or other resources? (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	
6	Ran out of food because of a lack of money or other resources? (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	
7	Were hungry but did not eat because there was not enough money or other resources for food? (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	
8	Went without eating for a whole day because of a lack of money or other resources? (Yes=1, No=0, 8=Don't Know, 9= Don't want to respond)	

Food Consumption Score (FCS)

Now I would like to ask you about your consumption of different foods and drinks. Would you please tell me how many days in the last 7 days you consumed any food item from a number of food groups? If different members of the household ate foods from same group different number of days, consider the highest number of days. (DO NOT INCLUDE FOODS EATEN OUTSIDE THE HOME)

Starchy Staples (cereals, roots, and tubers)	<input type="checkbox"/>
Vegetables	<input type="checkbox"/>
Fish/meat/Eggs	<input type="checkbox"/>
Pulses	<input type="checkbox"/>
Milk and milk products (Milk, cheese, yogurt and other dairy products)	<input type="checkbox"/>
Fruits	<input type="checkbox"/>
Oil/fat/ Butter	<input type="checkbox"/>
Sugar	<input type="checkbox"/>
Spices, salt, fish powder, small amounts of milk for tea	<input type="checkbox"/>

Salt Iodisation

WE WOULD LIKE TO CHECK WHETHER THE SALT USED IN YOUR HOUSEHOLD IS IODISED. MAY I HAVE A SAMPLE OF THE SALT USED TO COOK MEALS IN YOUR HOUSEHOLD? (OBSERVE)	1=Salt iodized 2=Salt not iodized 3= Cannot read the label 4= No salt in household
--	---

1b. WATER, SANITATION AND HYGIENE

What is the main source of drinking water used by the household	1=Public tap/standpipe 2=Piped water into dwelling 3= Tubewell/borehole 4= Protected well/spring 5=Bottled water 6= Unprotected well 7= Surface water (river/stream/pond) 99=Other
Which type of toilet facility does this household use?	1= Latrine with septic tank 2= Pit latrine with slab 3= Pit latrine without slab 4= Latrine without septic tank 77= No latrine/bush 99= Other
How many households use this toilet facility (including this household)?	
When do you think it is important to wash your hands? (multiple response)	1=Before cooking food 2=After defecation 3=Before eating food 4=After disposing of child's faeces 5=Before feeding/breastfeeding children 99=Others

Most often, what do you use to wash your hands?	1= Water only 2= Water and ash 3= Water and sand 4= Water and soap 5= Other
Are there any young children in the household (below 2 years)?	1=Yes 2=No
How do you normally disposed babies faeces/babies' diapers?	1=In the toilet 2=Buried 3=Rubbish bin 4=In open area 99=Other

2. CHILD MODULE

2a. ANTHROPOMETRY (0-59 months)

Child No	Name of the child	Consent given 1=Yes 2=No 3=Absent	What is the highest education level of the mother/ caregiver? 1=No education 2=Primary 3=Pre-Secondary 4=Secondary 5=More than secondary- Diploma, Bachelor, Master, PhD	SEX (Male=m Female=f)	Is official age documentation available? 1=Yes 2=No	Date of birth DD/ MM/ YYYY	Weight (Kg) ±0.1kg	Height/ Length (cm) □0.1cm/	Was the child measured lying down or standing up? 1=Lying down 2=Standing up
1									
2									
3									

Child No	Oedema (Yes=y No=n) NB: If yes, take a close up image of the child's feet	MUAC (+/-0.1 cm)
1		
2		

2b. IMMUNIZATION, MORBIDITY AND HEALTH-SEEKING BEHAVIOUR (0-59 months)

In the past 2 weeks (14 days) has (NAME) experienced diarrhoea?	(1=Yes, 2=No)
In the past 2 weeks (14 days) has (NAME) experienced acute respiratory infections (cough, breathing difficulties, chest in-drawing, rapid breathing)	(1=Yes, 2=No)
In the past 2 weeks (14 days) has (NAME) experienced fever (without cough) by maternal report	1=Yes, 2=No
Did (NAME) seek treatment?	1=Yes, 2=No
Where did (NAME) seek treatment for the illness (es)?	1= Private clinic, 2= Public health facilities/hospital, 3= Religious leader, 4=Traditional healer, 5=Pharmacy, 6=Home treatment, 99=Other
What prevented you from seeking treatment from a health facility?	1=Distance too far 2=Too expensive 3=Prefer other options 99=Other
Has (NAME) received two doses of measles immunization?	1=Yes confirmed by card; 2=Yes confirmed by recall; 3=No/Don't know
In your opinion, how many times should the child be immunized to complete immunization	<input type="checkbox"/>
Has (NAME) received Vitamin A in the last six months?	1=Yes 2=No, 88=Don't Know
During the last month did (name) receive micronutrient powder?	1=Yes, 2=No, 88=Don't know
Has (NAME) receive deworming medicine in last 6 months?	Yes=1, No=2, 88=Don't Know

2c. INFANT AND YOUNG CHILD FEEDING PRACTICES (0-23 months)

Has (NAME) ever been breastfed?	(1=Yes, 2=No, 88=Don't Know)
How long after birth did you first put \${NAME} to the breast?	(1= Less than 1 hour, 2= Between 1 and 23 hours, 3=24 hours or more, 88=Don't know)
Was [NAME] breastfed yesterday during the day or at night?	(1=Yes, 2=No, 88=Don't Know)
Yesterday, during the day or night, how many times did (NAME) breastfeed?	<input type="checkbox"/>
Yesterday, during the day or night, did (NAME) drink anything from a bottle with a nipple?	(1=Yes, 2=No, 88=Don't Know)
In your opinion, how long the baby should be exclusively breastfed?	<input type="checkbox"/>

Now I would like to ask you about all other liquids that (NAME) may have had yesterday during the day or the night. Please include liquids consumed outside of your home. Did (NAME) drink any of the following yesterday during the day or the night:	
[A] Plain water?	(1=Yes, 0=No, 8=Don't Know)
[B] Juice or juice drinks?	(1=Yes, 0=No, 8=Don't Know)
[C] (Local name for clear broth/clear soup?)	(1=Yes, 0=No, 8=Don't Know)
[D] Infant formula or growing up milk, such as (insert popular brands)?	1=Yes, 0=No, 8=Don't Know)
[D1] How many times did (name) drink infant formula? <i>If 7 or more times, record '7'. If unknown, record '8'.</i>	7=7 or more times 88=Don't know <input type="text"/>
[E] Milk from animals, such as fresh, tinned, or powdered milk?	(1=Yes, 0=No, 8=Don't Know)
[E1] How many times did (name) drink milk? <i>If 7 or more times, record '7'. If unknown, record '88'.</i>	7=7 or more times 88=Don't know <input type="text"/>
[F] Yoghurt	(1=Yes, 0=No, 88=Don't Know)
[F1] How many times did (name) drink yogurt? <i>If 7 or more times, record '7'. If unknown, record '88'.</i>	7=7 or more times 88=Don't know <input type="text"/>
[G] Any other liquids?	(1=Yes, 0=No, 88=Don't Know)
[X1] Record all other liquids mentioned.	(Specify)
Yesterday, during the day and night, did {NAME} eat solid, semi-solid or soft food?	(1=Yes, 0=No, 8=Don't Know)
How many times did {NAME} eat solid, semisolid, or soft foods other than liquids yesterday during the day or at night?	<input type="text"/>

Now I would like to ask you about some particular foods (**NAME**) may have eaten. I am particularly interested in whether he/she had the item even if it was combined with other food.

Yesterday during the day or the night, did (**NAME**) consume any of the following?

Did [**NAME**] eat any of the following food groups in *the PAST 24-HOURS* (1=Yes, 2=No)

1. Grains, roots, tubers	Porridge, bread, noodles or other foods made from rice wheat, barley, or oats Porridge, bread, noodles, or other foods made from corn/maize, sorghum or millet grains White potatoes, white yams, cassava, green banana, potato chips, sugar beets or any other foods made from these	
2. Legumes or nuts (lentils)	Beans, peas, other lentils, nuts (peanuts) or seeds (pumpkin seed, spinach seed, jackfruit seed) or any foods made from these	
3. Dairy products (cheese or other foods)	Cheese or other foods made from animal milk	
4. Flesh foods (meat, fish, poultry, liver/organ meat)	Liver, kidney, heart or other organ meats or blood-based foods	
	Meat such as beef, pork, lamb, mutton, rabbit, game, chicken, duck, pigeon other birds	
	Fresh or dried fish, shellfish or seafood like shrimp	
5. Vitamin A rich fruits and vegetables (carrot, pumpkin, orange sweet potato, mango, papaya, dark green leafy vegetables, long beans)	Pumpkin, carrots, squash, sweet potatoes, sweet peppers; any dark green leafy vegetables such as spinach pumpkin leaf, ripe mangoes, cantaloupe, ripe papaya, dried peach, and 100% fruit juice made from these items	
6. Egg	Eggs from chickens, duck, guinea fowl or any other egg	
7. Other fruit and vegetables (banana, apples, pineapple, watermelon, eggplant, onion, cucumbers, tomatoes)	Cabbage, tomato, onion, eggplant	
8. Any oil, fats, butter, ghee or foods made with any of these		
9. Any sweet junk foods, such as chocolates/ sweets/ candies/ sweet biscuits/pastries/ cakes?		
10. Any savoury junk foods such as crisps/chips/salted biscuits/instant noodles		
11. Any lipid based nutrient supplement (LNS) like Plumpy nut, Plumpy sup; any other specialized nutritious foods like fortified blended foods (FBFs) or high energy biscuits (HEBs) like WSB+ /++ or WFP biscuits		

Since (name) was born, were you counselled on how to take care of your child?	(1=Yes, 2=No, 88=Don't Know)
From whom did you receive advice?	1=Health worker 2=Community health volunteer/mother support group 3=Family / Relatives 4=Other pregnant women 99=Other
Have you been counselled on giving complementary foods?	(1=Yes, 2=No, 88=Don't Know)
In your opinion, how old should the baby should be given complementary foods?	<input type="text"/> months
How did you get information on health, nutrition and feeding practices? (multiple response)	1= Health care workers (Nurse, Midwife, Doctor, assistant nurse, nutrition officers, etc) 2=Community Health Volunteers (Family Health Promoters and Mother Support Groups) 3=Family/Relatives 4=Media 5=TV 6=Radio 7=Newspapers 8=Internet 9=Social media: Facebook 10=Text messages from Telcom providers 11=Community leaders (Xefe Suku and Xefe Aldeia) 12=Schools 99=Other

3.MATERNAL MODULE-WOMEN OF REPRODUCTIVE AGE (15-49 years)

Woman ID	
Name of the woman	
Consent given?	(1=Yes, 2=No, 3=Absent)
How old are you? (in years)	<input type="text"/>
Weight (+/- 0/1kg)	<input type="text"/>
Height (+/- 0.1cm)	<input type="text"/>
MUAC (+/-0.1cm)	<input type="text"/>
Are you pregnant?	(1=Yes, 2=No, 88=Don't Know)
Are you lactating?	(1=Yes, 2=No)
Did you give birth in the last 5 years?	(1=Yes, 2=No)
How many children do you have?	<input type="text"/>
Did you see anyone for antenatal care during the last pregnancy	(1=Yes, 2=No)

Whom did you see for antenatal care during your last pregnancy?	1= Midwife 2= Medical doctor 3=Nurse 4=Nurse assistant 5=Traditional birth attendant 99=Other
Where did you get antenatal care?	1=At home: 2=Public health facilities 3= Private health facilities 4=Outreach services (SISCa, Mobile Clinic) 99=Other
Do you have a mother and child health handbook (LISIO)	1=Yes, 2=No
How many months pregnant were you when you first received antenatal care for this pregnancy?	<input type="checkbox"/> 88=Don't know
How many times did you receive antenatal care during this pregnancy?	<input type="checkbox"/>
During your last pregnancy, did you consume any vitamin or mineral tablets or syrups?	1=Yes, 2=No, 88=Don't Know
What type of vitamin or mineral tablets or syrup did you take? (multiple)	1=Iron/iron folic acid tablet 2=Mixed vitamins/minerals 99=Other
During the whole pregnancy, how many months did you take the tablets or syrup?	<input type="checkbox"/> 88=Don't know
Where did you get these vitamins and/or minerals	1 = Public health facilities 2= Private clinics 3= Pharmacy 99= Other
In your opinion, why do you think that iron/folic acid is important for pregnant women? (Multiple response)	1= Prevent anemia 2 = Healthy baby 3= Protects against infection 4= Boosts mother's immunity 5= Better delivery outcome 88= Don't know 99= Other

Minimum Dietary Diversity for Women (MDD-W)

Now I would like to ask you about some particular foods and drinks. Would you please tell me whether you consumed any food item from a number of food groups yesterday during the day and night, including foods purchased and eaten outside the home.

	Food Categories	Description/examples to be adapted locally	Consumed	
			1=Yes	0=No
1a.	Any foods made from grains	Porridge, bread, rice, pasta/noodles or other foods made from grains		
1b.	Any white roots and tubers or plantains	White potatoes, white yams, manioc/cassava/ yucca, coco yam, taro or any other foods made from white-fleshed roots or tubers, or plantains		
2.	Any beans or peas	Mature beans or peas (fresh or dried seed), lentils or bean/pea products, including hummus, tofu and tempeh		
3.	Any nuts or seeds	Any tree nut, groundnut/peanut, or certain seeds or nut/seed “butters” or pastes		
4.	Any milk or milk products	Milk, cheese, yoghurt or other milk products, but NOT including butter, ice cream, cream or sour cream		
5a.	Any meat made from animal organs	Liver, kidney, heart or other organ meats or blood-based foods, including from wild game		
5b.	Any other types of meat or poultry	Beef, pork, lamb, goat, rabbit, wild game meat, chicken, duck, other birds		
5c.	Any fish or seafood, whether fresh or dried	Fresh or dried fish, shellfish or seafood		
6.	Any eggs	Eggs from poultry or any other bird		
7.	Any dark green leafy vegetables	List examples of any medium-to-dark green leafy vegetables, including wild/foraged leaves		
8a.	Any vegetables or roots that are orange-coloured inside	Pumpkin, carrots, squash or sweet potatoes that are yellow or orange inside		
8b.	Any fruits that are dark yellow or orange inside	Ripe mango, ripe papaya		
9.	Any other vegetables	List examples of any other vegetables		
10.	Any other fruits	List examples of any other fruits		
11.	Sugar food consumption (sweets)	Cakes, cookies, sweet biscuits, candy, chocolates, etc.		
12.	Sugary drinks	Carbonated soft drink, sweetened tea, sweetened coffee		
13.	Savory “junk foods”	Instant noodles, fried chips/crisps, fried snacks including crispy fried beans, wheat, corn or rice snacks, etc.

Annex 7. Interviewer manual

TIMOR-LESTE NATIONAL FOOD AND NUTRITION SURVEY (TLFNS 2020)

INTERVIEWER MANUAL

February 2020

Introduction

The interviewer manual covers all the important aspects of the data collection process for the Timor-Leste National Food and Nutrition Survey (TLFNS) which is expected to be conducted from 17 February 2020 in all the 13 municipalities. Data collection will involve the collection of data from a representative sample of 980 households in each municipality as specified in the survey protocol. There will be 80 clusters sampled in each household, with 56 clusters having 12 households, and 24 clusters with 13 households. Each of the survey teams will be expected to complete a cluster each day. Given that there will be 16 teams, in 10 working days, 2 municipalities will be completed, with 8 teams in each municipality.

This manual covers the following key aspects:

- Survey team structure and responsibilities
- Sampling, household selection and field procedures
- Questionnaire guidance
- Anthropometry
- Mobile data collection
- Team checklist

Unit 1. Survey team structure and responsibilities

Each survey team will be structured as follows:

The structure of each survey team was presented as below:

- 1 Measurer: responsible for reading all anthropometric measurements for children below 5 years and women of reproductive age.
- 1 Assistant measurer/enumerator: to assist the measurer by ensuring that the respondent is in the correct position for measurement and also for recording the measurement on the data forms; also to administer the child and maternal questionnaires using the android tablet.
- 1 interviewer: to introduce the team in each household, to complete the household listing form and to administer the household questionnaire.
- 1 supervisor: to oversee the sampling and household selection, the overall team organisation, quality control and validation of questionnaires and forms from the team before finalizing and sending questionnaires to the server on a daily basis.

Unit 2. Sampling, household selection and field procedures

SAMPLING METHOD

The required number of households in each cluster will be selected using systematic random sampling with a random starting point will be used as illustrated above. The steps will be as follows:

1. Identify the centre of the cluster.
2. Move to the approximate centre of the cluster.
3. Divide the number of households by the sample size (the number required). eg. If there are 45 households, and you need 14, then $45/14=3.2$, rounded down to 3.
4. Select a random direction by spinning a bottle/pen on the ground.
5. Walk in the direction of the pen, counting households as you pass, up to the number calculated in step 3 (1, 2, 3).
6. Interview the next household (this becomes your first household).
7. Interview this household
8. Spin the pen in a new direction and follow the steps above

The diagram below shows the steps. The shaded cells represent the households which have been skipped. The unshaded cells represent the selected households.

The method needs slight adjustment when:

1. There is more than 1 cluster in the aldeia: divide the aldeia into segments using roads, rivers, cluster of houses into the required number then treat the segments as clusters.
2. The aldeia has more than 100 households: use the same segmentation method then randomly select one of the segments as the cluster. If 100-200, then select 2 segments, if 201-300, select 3 segments, if 301-400, select 4 segments etc.

NOTE: If you reach the boundary of the cluster while counting households in a given direction, select a new random direction.

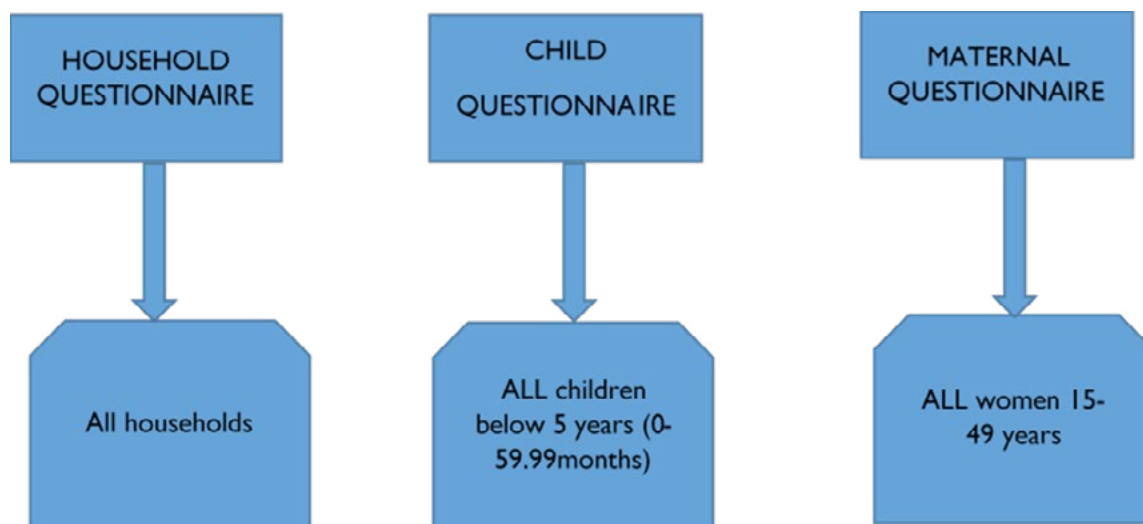

SPECIAL CASES IN THE FIELD

A household will be defined as a group of people who normally live together and eat from the same pot. Compounds in which more than 1 family lives will be split into households if the families eat separately.

- Empty households: These will be replaced. An empty household is one where the members of the household are not present and are not expected to return within the time of the survey. These will not be counted when selecting households.
- No children in the household: Complete all the other questionnaires for that household
- Absent children: Return to the household later to complete the interview
- Children with disability/handicap: If height, weight or MUAC cannot be measured, record as absent
- Child in a centre/institution: Record as absent

Unit 3. Questionnaire guidance

STRUCTURE OF SURVEY QUESTIONNAIRE

A household with no children below 5 years will still be interviewed for the household and maternal questionnaires. A household without women 15-49 years will still be interviewed for the household and child questionnaire. **ALL** eligible children below 5 years and **ALL** eligible women 15-49 years will be interviewed.

IMPORTANT POINTS TO NOTE ON SPECIFIC QUESTIONS

1. Household Questionnaire

- i. *How many people live in this household:* This refers to usual household residents and does not include visitors.
- ii. *Type of floor/wall/roof in the household:* Observe as much as possible; if you are sure of your observation, record the response; only ask if you cannot observe.
- iii. *Which of the following household assets does this household own:* record YES if at least one member has the asset.
- iv. *Food Consumption Score...the question begins with: Now I would like to ask you about your consumption of different foods and drinks. Would you please tell me how many days in the last 7 days you consumed any food item from a number of food groups? If different members of the household ate foods from same group different number of days, consider the highest number of days. (DO NOT INCLUDE FOODS EATEN OUTSIDE THE HOME):*

Point number 1: Foods eaten outside the home must not be included.

Point number 2: If anyone in the household ate a particular food, even if it was only one person, this should be included.

- v. *What is the main source of drinking water used by the household/Which type of toilet facility does this household use:* Do not read the responses.
- vi. *How many households use this toilet facility (including this household):* If no other household is using the toilet, the response is 1. If 1 other household is using it, then the response is 2.

A household listing form must be used to record all members of the household. An example is shown below:

Date: 29/01/2020 Municipality: Manatuto Cluster No: 5 Team No: 8 Household No: 11								
No.	Please tell me the name of each person who usually lives here, beginning with the head of the household	Is (name) male or female? M=Male F=Female	How old is (name) in completed years? Enter 0 if below 1 year	Total HH members	Total number of WRA (15-49 y)	Total number of children <5y	Status of interview 1=Completed 2=Partially completed 3=Refused	Comments
1	Carlos	M	41	6	1	3	1	
2	Eva	F	35					
3	Adam	M	21					
4	Eduardo	M	4					
5	Ricardo	M	3					
6	Jane	F	0					

2. Child Questionnaire

- i. *Is official age documentation available:* Official age documentation refers to the birth certificate or child health/vaccination card/maternal-child card.
- ii. *Weight, Height and MUAC measurements MUST HAVE DECIMALS.* Weight is to the nearest 0.1kg, eg. 12.4, 17.3, 18.8. Height is to the nearest 0.1cm, eg. 98.1, 67.4, 75.5. MUAC must be to the nearest 0.1cm, eg. 13.4, 14.9, 19.6.
- iii. **BEWARE OF DIGIT PREFERENCE IN ALL MEASUREMENTS...**this means that you must not round to the nearest .0 or 0.5 otherwise RESULTS WILL BE REJECTED!
- iv. **OEDEMA:** ALL cases must be checked and confirmed by the supervisor and a close picture must be taken for confirmation.
- v. **DIARRHOEA:** It is defined as 3 or more loose or watery stools in a period of 24 hours.
- vi. For the Vitamin A question, samples must be shown to the respondent.
- vii. On the infant and young child feeding section, the question on liquids begins with: *Now I would like to ask you about all other liquids that (NAME) may have had yesterday during the day or the night. Please include liquids consumed outside of your home. Did (NAME) drink any of the following yesterday during the day or the night:*
Note that a soup/broth which has small pieces of meat or vegetable in it is classified as a liquid.
- viii. The question: How did you get information on health, nutrition and feeding practices? (multiple response) can have more than 1 response.

3. Maternal questionnaire

- i. A sample of the LISIO should be shown for the question: *Do you have a mother and child health handbook (LISIO)*
- ii. The question on the importance of iron/folic acid is a multiple response question.
- iii. The question of minimum dietary diversity for women should include foods purchased and eaten outside the home.

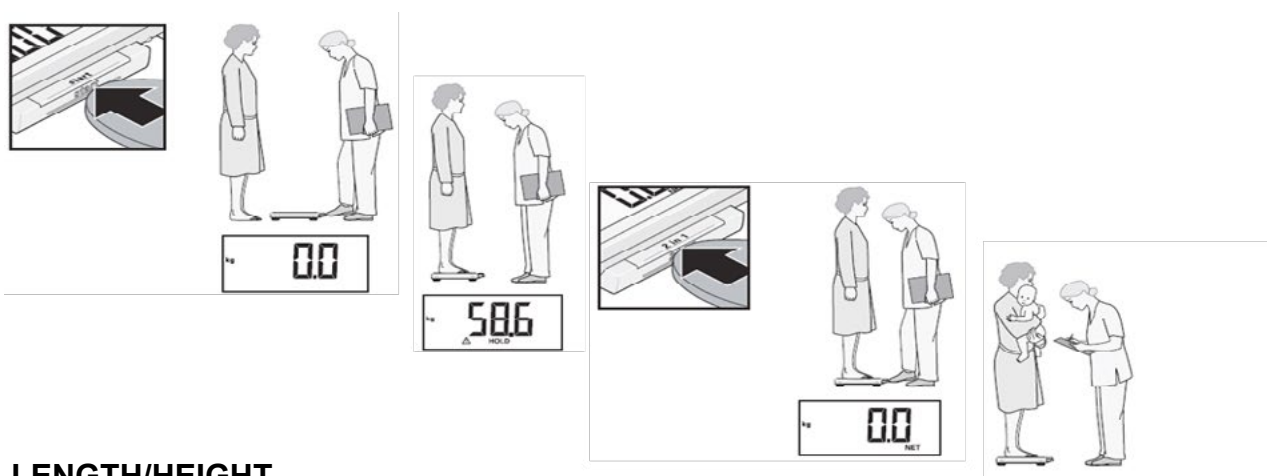

Unit 4. Anthropometry

INTRODUCTION

It is important to record all the variables correctly: sex, date of birth, weight, height, MUAC and oedema. For weight measurement, the child should be undressed to the minimum, ie. If wearing a dress, she can remove the dress and remain with under clothes. For boys, they may remove their shirts and shorts and remain with the under pants.

WEIGHT

For children who cannot stand on their own, the mother stands on the scale and then the scale is adjusted to zero, then the child is handed over to the mother, then the measurement is read to the nearest 0.1kg (1 decimal place). Children who are able to stand can stand alone on the scale. The same procedure is used for women of reproductive age.

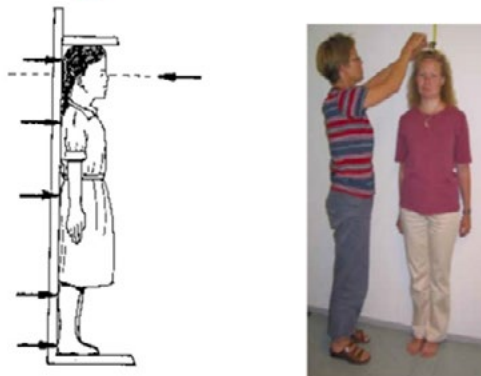

LENGTH/HEIGHT

Children below 2 years (6 to 23.99 months) must be measured lying down; children 2 years and above (24 to 59.99 months) must be measured standing up. The questionnaire also requires the enumerator to specify whether the child was measured lying down or standing up, which is very important. There may be cases where children below 2 years cannot be measured lying down, possibly due to ill health. In such cases, they may be measured standing up and an automatic adjustment will be made in data analysis. The picture below shows the procedure. It is important to ensure that the measurer and assistant measurer are in the correct position before reading the measurement.

Height will also be measured for adult women of reproductive age. The position during measurement is similar to what is required for children.

Height is measured to the nearest 0.1cm. **BEWARE OF DIGIT PREFERENCE!**

MID UPPER ARM CIRCUMFERENCE (MUAC)

MUAC measurement begins with identification of the middle of the upper arm by measuring the mid-point from the tip of the elbow to the tip of the shoulder.

This point is then marked.

The tape is then put around the arm to read the measurement, ensuring that it is neither loose nor tight.

The measurement is read to the nearest 0.1cm.

BEWARE OF DIGIT PREFERECE!

OEDEMA

Nutritional oedema is identified as follows:

1. Apply normal thumb pressure on both feet for three seconds (count the numbers 101, 102, 103)
2. If a shallow print persists on both feet, then the child has nutritional oedema (bilateral pitting oedema).

DATA FORM FOR ANTHROPOMETRY

Before child and maternal questionnaires are completed on the tablet, the measurements will be taken and recorded on the data forms as shown below. The data forms must be submitted to the supervisor together with the tablets at the end of each day.

Date: 14/02/2020 Municipality: Baucau Cluster No: 14 Team No: 3									
HH No	Name	Sex (M/F)	Date of birth (DD/MM/YYYY)	Weight (kg)	Height (cm)	Measured 1=Standing up 2=Lying down	MUAC (mm)	Oedema (y/n)	Comment (for missing data etc)
1	Carla	F	01/02/2018	12.1	89.2	2	124	n	
1	Eden	F	12/09/2016	10.9	78.1	1	134	n	
1	Amivi	F	13/12/2019	8.3	90.4	2	145	n	
2	Jose	M	01/08/2020	10.1	81.3	2	167	n	

Date: 01/02/2020 Municipality: Bobonaro Cluster No: 35 Team No: 9						
HH No	Name	Age (years)	Weight (kg)	Height (cm)	MUAC (mm)	Comment (for missing data etc)
1	Paula	23	56.1	156.1	156	
1	Anna	28	68.1	146.4	178	
2	Sarah	39	45.6	179.5	214	
2	Emilia	42	49.0	140.1	231	

AGE ESTIMATION

There may be cases where there is no official age documentation. In this case, the mother/care giver may provide the date of birth of the child (DD/MM/YYYY). If she does not remember the date, the local calendar of events can be used to identify the month and year based on past events. In cases where the day cannot be recalled, 15 can be entered. This is based on the WHO/UNICEF latest guidance for anthropometric surveys. Part of the calendar of events is displayed below.

Month	Seasons	2015	2016	2017	2018	2019	2020
January	Wet season	1 January New Year's Day	1 January New Year's Day	1 January New Year's Day	1 January New Year's Day	1 January New Year's Day	1 January New Year's Day
February	Wet season	18 February Ash Wednesday	10 February Ash Wednesday		14 February Ash Wednesday		26 February Ash Wednesday
March	Wet season		25 March Good Friday	1 March Ash Wednesday	30 March Good Friday	6 March Ash Wednesday	
April	Wet season	3 April Good Friday		14 April Good Friday		19 April Good Friday	
May	Dry season	1 May Labour Day 20 May Independence Restoration Day	1 May Labour Day 20 May Independence Restoration Day 26 May Corpus Christi	1 May Labour Day 20 May Independence Restoration Day	1 May Labour Day 20 May Independence Restoration Day 31 May Corpus Christi	1 May Labour Day 20 May Independence Restoration Day	

REFERRAL

Children below 5 years found to be malnourished during the survey will be referred to the nearest facility following the criteria below:

1. Children with WHZ below -3SD (using weight-for-length and weight-for-height tables)
2. Children with MUAC below 11.5cm
3. Children with nutritional oedema

A referral form will provided for this purpose.

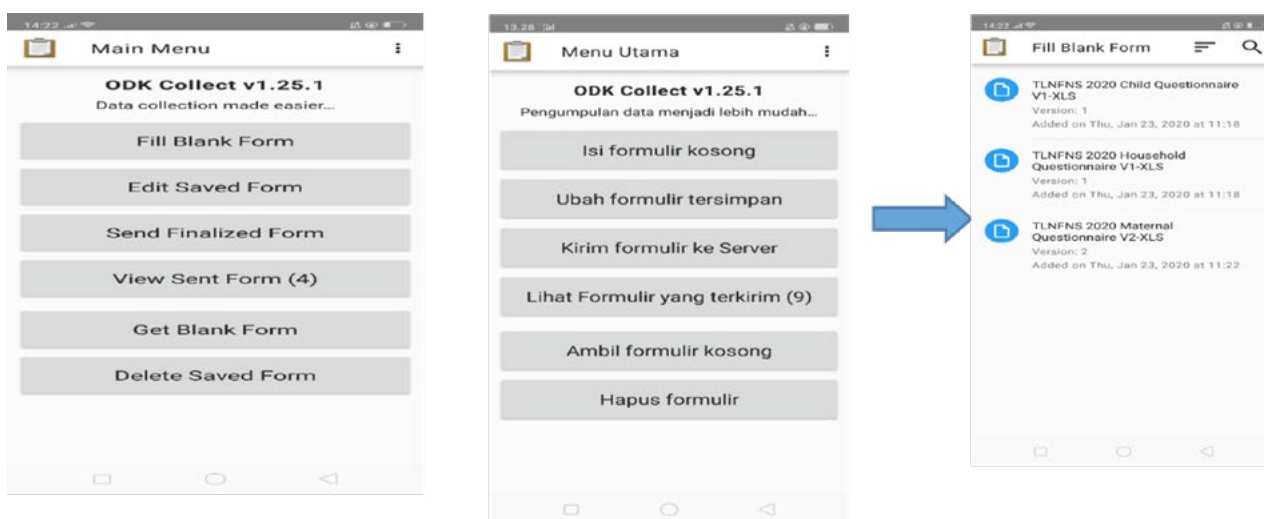

Unit 5. Mobile data collection

1. Safe-keeping, maintenance and general management

- Enumerators and interviewers must take good care of the tablets and must not abuse them by using them for anything else apart from data entry in the survey.
- Supervisors must ensure that tablets are fully charged before each day of data collection.
- As soon as you switch on the tablet, check the date and time and correct them if necessary.
- Adjust the screen brightness as bright light may deplete the battery.
- For the interviewer, make sure that location is switched on as it is required for taking the GPS.

2. Basic ODK screen

The main ODK screen is shown below. “Fill Blank Form/isi formulir kosong” is for opening a new questionnaire, and moves the screen to the list of questionnaires, from which you then make a selection. “Edit Saved Form/Ubah formulir tersimpan” is for making changes to a questionnaire which has been started. “Send Finalized Form/Kirim formulir ke Server” is used for sending finalized questionnaires to the server. This should only be done by the supervisor. “View Sent Form/Lihat Formulir yang terkirim” is used for viewing questionnaires which have been sent to the server. “Get Blank Form” is used for uploading questionnaires to the tablet, and must only be used by the supervisor only after consultation with the Survey Coordinator if necessary. “Delete Saved Form/Hapus formulir” is used for deleting a questionnaire in case it was started by mistake.

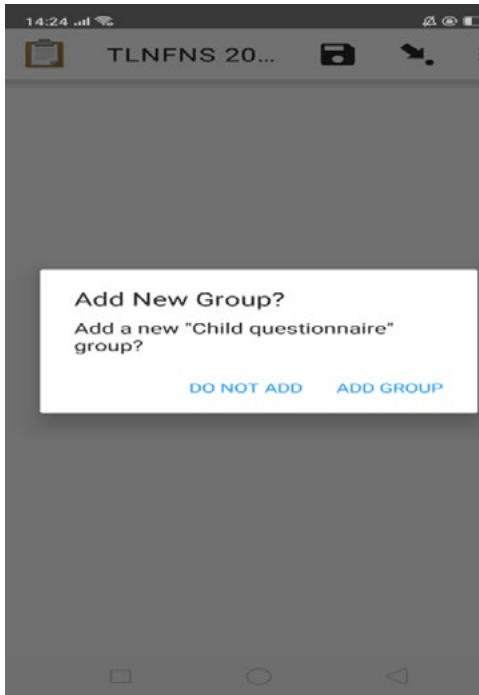

3. Important things to note at the beginning of a questionnaire:

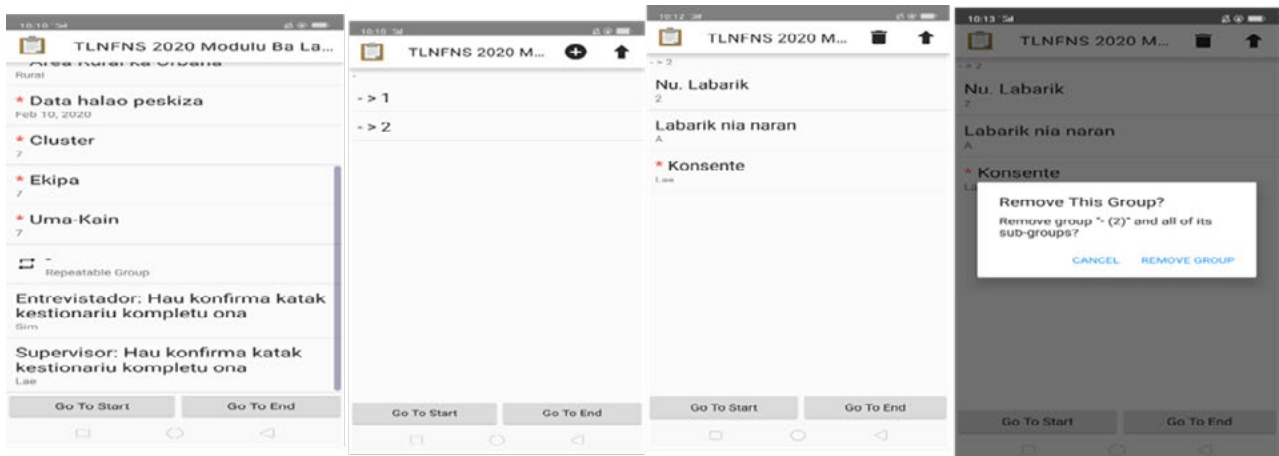

- The date of interview, municipality, urban/rural, suco, aldeia, cluster number and household number must be the correct ones.
- Do not start a questionnaire before confirming that it is relevant. For example, if there are no children below 5 years in the household, then there should be no child questionnaire.

4. Important information for individual questionnaires:

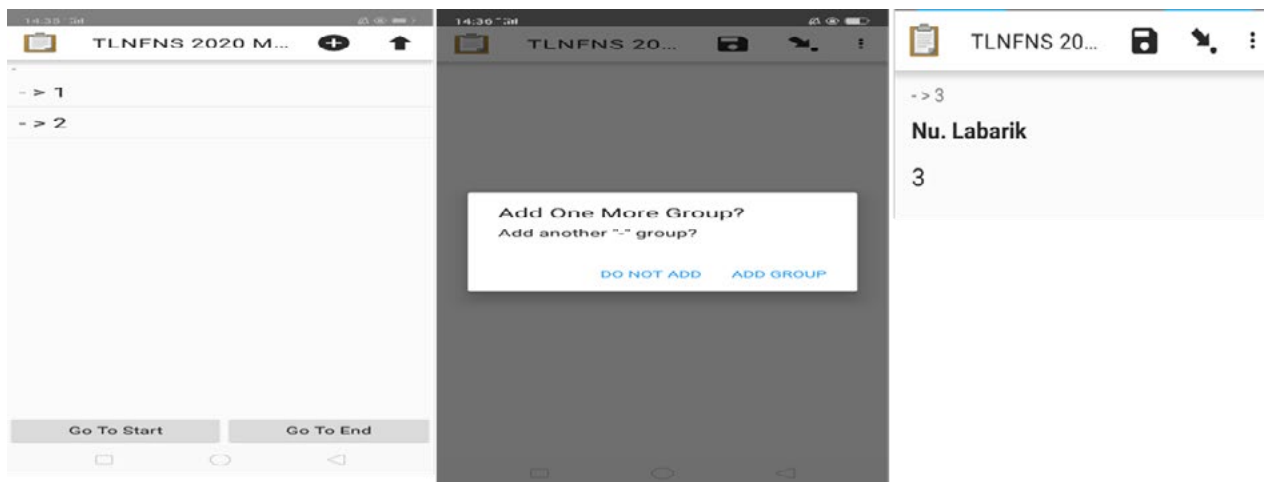

- After entering data for one child/woman, there will be a note on the screen requesting you to add a new group/Tambah grup baru. To add another child/woman, select “Add Group/Tambah Grup”.

NOTE: To remove a group which has been added by mistake, go to EDIT SAVED FORM, scroll down to the REPEATABLE GROUP, click on the ID of the record you want to delete, then remove the group by clicking 

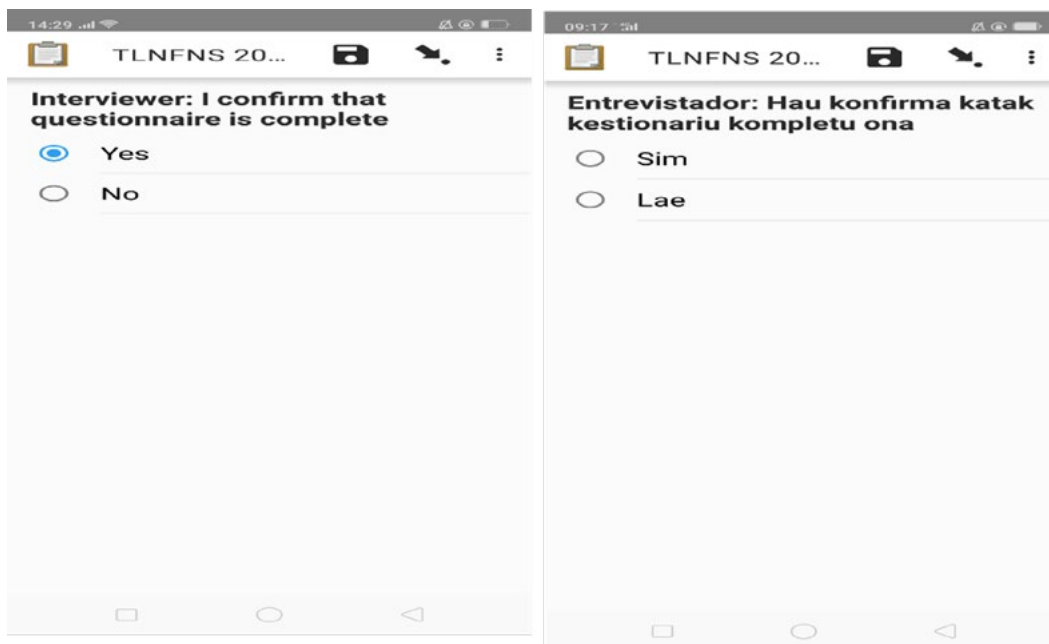

If DO NOT ADD has been selected instead of ADD GROUP, a child or women can be added later by clicking  as shown below and selecting ADD GROUP:

5. At the end of the questionnaire:

- The interviewer confirms that the questionnaire is complete.
- The supervisor will check and confirm later (this should be selected as NO until the supervisor checks and confirms)
- The interviewer/enumerator saves the questionnaire (without finalizing) and exits

6. Notes for the supervisor

Pre-submission checking

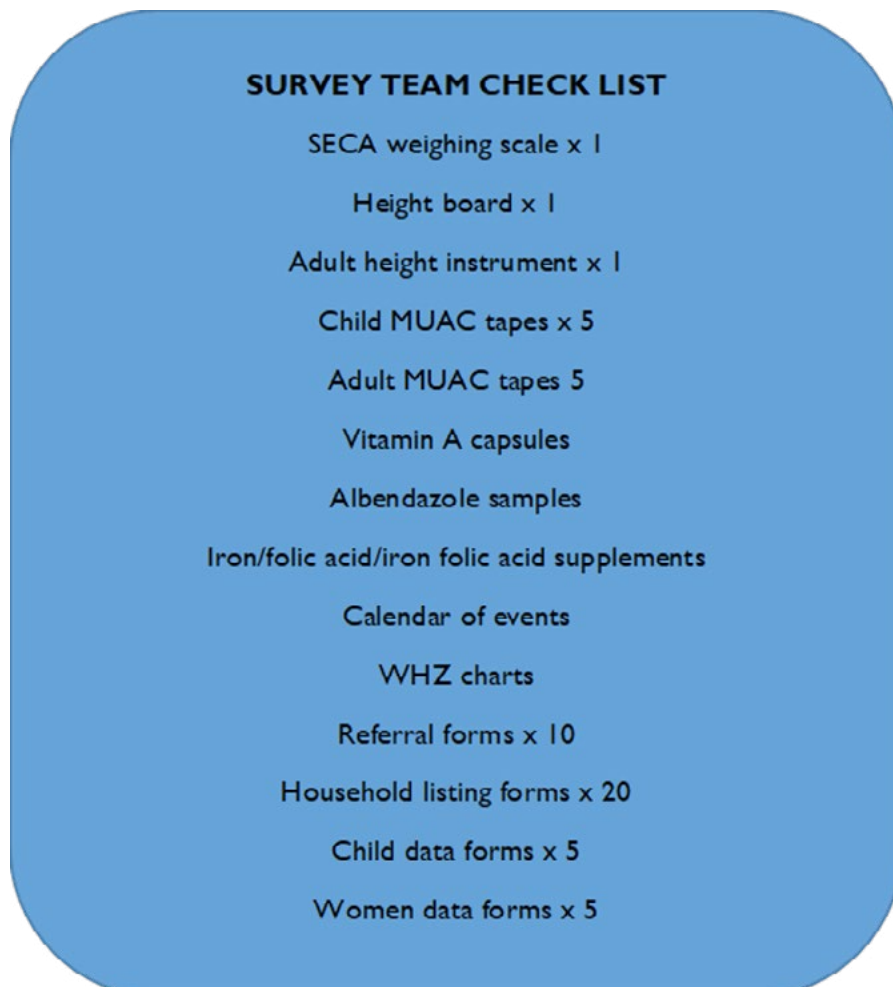

- Date of interview, Municipality, Suco, Aldeia, Cluster number must be checked for all questionnaires for consistency
- The number of people in the household must correspond to the household listing form
- Anthropometric measurements: must correspond to data form for children and women
- Check for missing data such as date of birth, weight, height, MUAC
- Check if the interviewer marked the questionnaire as complete

Questionnaire finalization and sending

- You can only send questionnaires after finalizing
- You can only questionnaires when connected to the internet
- Check and finalize all questionnaires then send them to the server at one time

Unit 6. Survey team check list

Before departure to the field every day, each survey team must check that they have the items below:

Annex 8. Field supervision checklist

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
A	General					
A1	Does the team follow the correct procedure in identifying the first household to be interviewed and subsequent households?					
A2	Do the teams introduce themselves and seek verbal consent at the beginning of the interview?					
A3	Are questions asked as they appear on the questionnaire?					
A4	Are teams clearly explaining the household definition to each household?					
A5	Does the team thank respondents at the end of each interview?					

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
B	Age determination					
B1	Is the team entering the exact date of birth when using the official age documentation?					
B2	Is the team using the events calendar when the mother does not remember the date of birth?					
B3	Is the team using the events calendar correctly?					

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
C	Weight measurement					
C1	Is the weight scale placed on a flat surface?					
C2	Are all children weighed with minimum clothing?					
C3	Is the child in the center of the scale, arms at side, looking straight ahead while being weighed?					
C4	Is the 2-in-1 function used properly?					

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
D	Height measurement					
D1	Is the height board clipped together tightly (rear)					
D2	Are children below 2 years) measured lying down and children 2 years and above measured standing?					
D3	Is the child perfectly centered on the height board (ankles->hips->shoulders->head)?					

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
E	MUAC/edema					
E1	Is the midpoint of the arm marked?					
E2	Do they surveyors talk to the women, explain what they are doing (when taking the MUAC), allow them to feel comfortable and covered aside from their left arm/shoulder?					
E3	Is edema checked for every child?					
E4	Is oedema checked correctly in both feet together?					

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
F	Materials					
F1	Are teams keeping measurement materials out of direct sunlight and protected from the rain?					
F2	Are teams replacing MUAC tapes as soon as they become bent?					

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
G	Morbidity					
G1	Are teams keeping measurement materials out of direct sunlight and protected from the rain?					
G2	Are teams replacing MUAC tapes as soon as they become bent?					

Things to Look at		Tick only one of the columns			Did supervisor explain and take initiative to correct the enumerators? (Yes/No)	Overall Comments
		Follow Instruction Properly	Follow the instruction but Need to Improve	Don't follow the Instruction		
H	Team dynamics					
H1	Are team members supportive and encouraging towards one another?
